

1) We are given  $xy^3 = 80$  and that  $\frac{dy}{dt} = -0.8$  ft/sec when  $y = 10$  ft

And we want  $\frac{dx}{dt}$  when  $y = 10$  ft

Use implicit differentiation:

$$xy^3 = 80$$

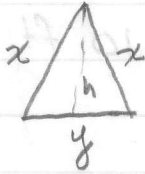

$$\Rightarrow \frac{dx}{dt} y^3 + 3y^2 \frac{dy}{dt} x = 0$$

$$\Rightarrow \frac{dx}{dt} = \frac{-3y^2 x \frac{dy}{dt}}{y^3}$$

when  $y = 10$ ,  $x = \frac{80}{10^3} = .08$

$$\Rightarrow \frac{dx}{dt} = \frac{-3(.08)(-0.8)}{10} = .019 \text{ ft/s}$$

2)

$$2x + y = p \Rightarrow x = \frac{p-y}{2}$$

$$\text{Area} = A = \frac{1}{2}bh$$

see that by Pythagoras

$$h = \sqrt{x^2 - \left(\frac{y}{2}\right)^2}$$

$$\Rightarrow \text{Area} = \frac{1}{2}y\sqrt{x^2 - \left(\frac{y}{2}\right)^2}$$

now substitute in for  $x$ :

$$\begin{aligned} A(y) &= \frac{1}{2}y\sqrt{\left(\frac{p-y}{2}\right)^2 - \left(\frac{y}{2}\right)^2} \\ &= \frac{1}{2}y\sqrt{\frac{p^2 - 2py + y^2 - y^2}{4}} \end{aligned}$$

$$A(y) = \frac{1}{4}y\sqrt{p^2 - 2py}$$

$$A'(y) = \frac{1}{4}\sqrt{p^2 - 2py} + \frac{1}{4}y \cdot (-2p) \cdot \frac{1}{2\sqrt{p^2 - 2py}}$$

now set this equal to zero and multiply by  $4\sqrt{p^2 - 2py}$ :

$$\Rightarrow p^2 - 2py - py = 0$$

$$\Rightarrow p - 3y = 0$$

$$\Rightarrow y = \frac{1}{3}p$$

Since the endpoints of the interval give  $A = 0$  ft<sup>2</sup> (minima), we see that  $y = x = \frac{1}{3}p$  gives the maximal area.

$$3) f(x) = \frac{x^2 + 5x + 4}{x}$$

First, examine limits:  $\lim_{x \rightarrow \infty} f(x) = +\infty$ ,  $\lim_{x \rightarrow -\infty} f(x) = -\infty$   
 also, we see that we have a vertical asymptote at  $x = 0$ , and  $\lim_{x \rightarrow 0^+} = +\infty$ ,  $\lim_{x \rightarrow 0^-} = -\infty$

Also, see that  $f(x) = \frac{(x+4)(x+1)}{x}$

$\Rightarrow f(x) = 0$  for  $x = -1, -4$ , so we have the only roots at these points.

$$f'(x) = \frac{x(2x+5) - (x^2 + 5x + 4)}{x^2} = \frac{2x^2 + 5x - x^2 - 5x - 4}{x^2} = \frac{x^2 - 4}{x^2}$$

And we see  $f'(x) = 0$  for  $x = \pm 2$

and since  $f'(x) = \frac{x^2 - 4}{x^2} = 1 - \frac{4}{x^2}$

$$\Rightarrow f''(x) = -2 \cdot (-4) \cdot x^{-3} = \frac{8}{x^3}$$

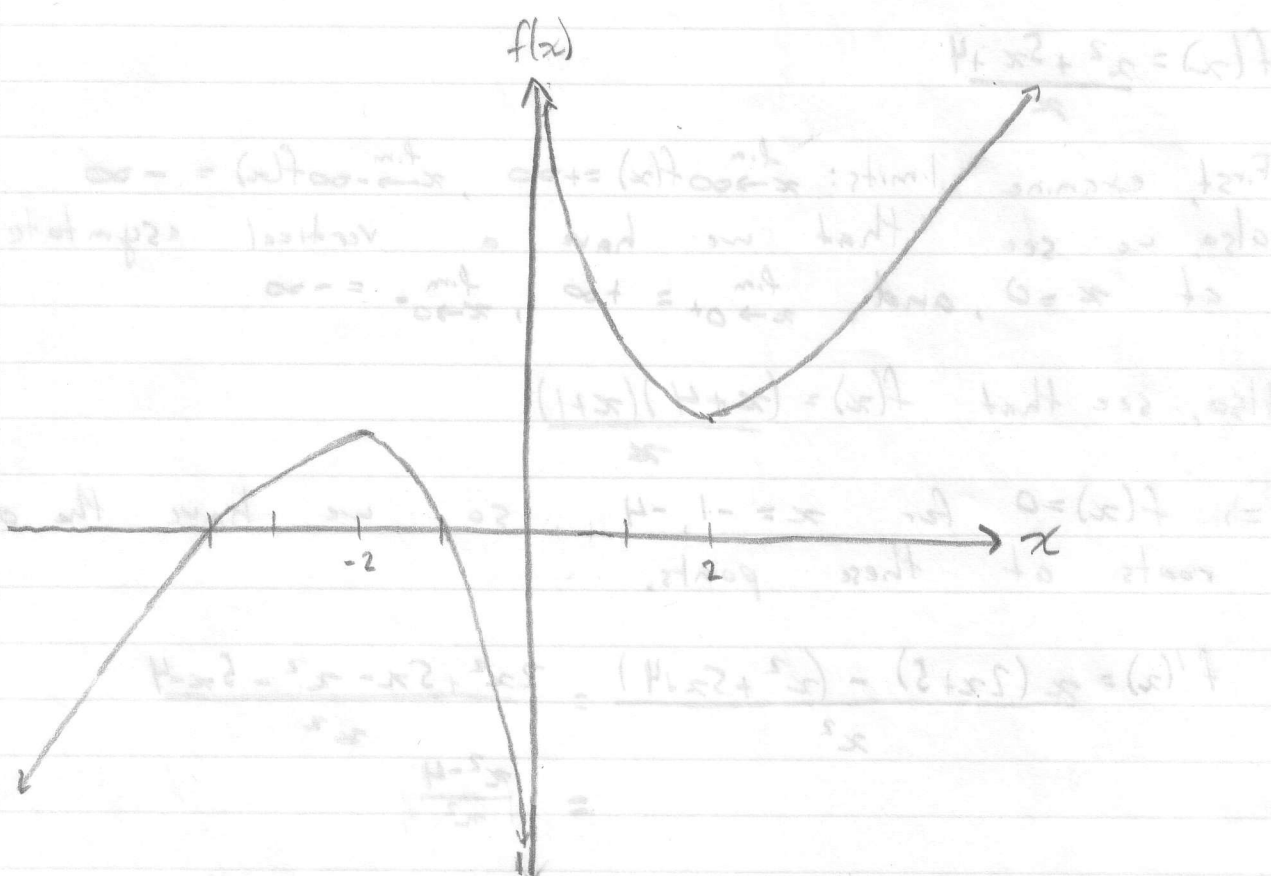

and so  $f''(x) < 0$  for  $x < 0$

and  $f''(x) > 0$  for  $x > 0$

so  $f$  is concave down on  $(-\infty, 0)$

and  $f$  is concave up on  $(0, \infty)$

So now we can graph it!

$$f(x) = x^3 - 3x^2 + 2x$$

$$f'(x) = 3x^2 - 6x + 2 = 0 \quad \text{for } x = \pm 1 \pm \frac{\sqrt{5}}{3}$$

$$\text{And since } f''(x) = \frac{2x}{5} = 1 - \frac{1}{5}$$

$$\text{and } f''(x) = -5 \cdot (-1) \cdot \frac{2}{5} = \frac{2}{5}$$

and so  $f''(x) > 0$  for  $x < 0$   
and  $f''(x) < 0$  for  $x > 0$

and  $f$  is concave up on  $(-\infty, 0)$   
and  $f$  is concave down on  $(0, \infty)$

is now we can graph it!
