

The  
Structure  
From Motion  
problem

*Oliver Knill, October 29,  
2007, Colby College*

or “The  
Mathematics  
of  
Panorama  
photography”

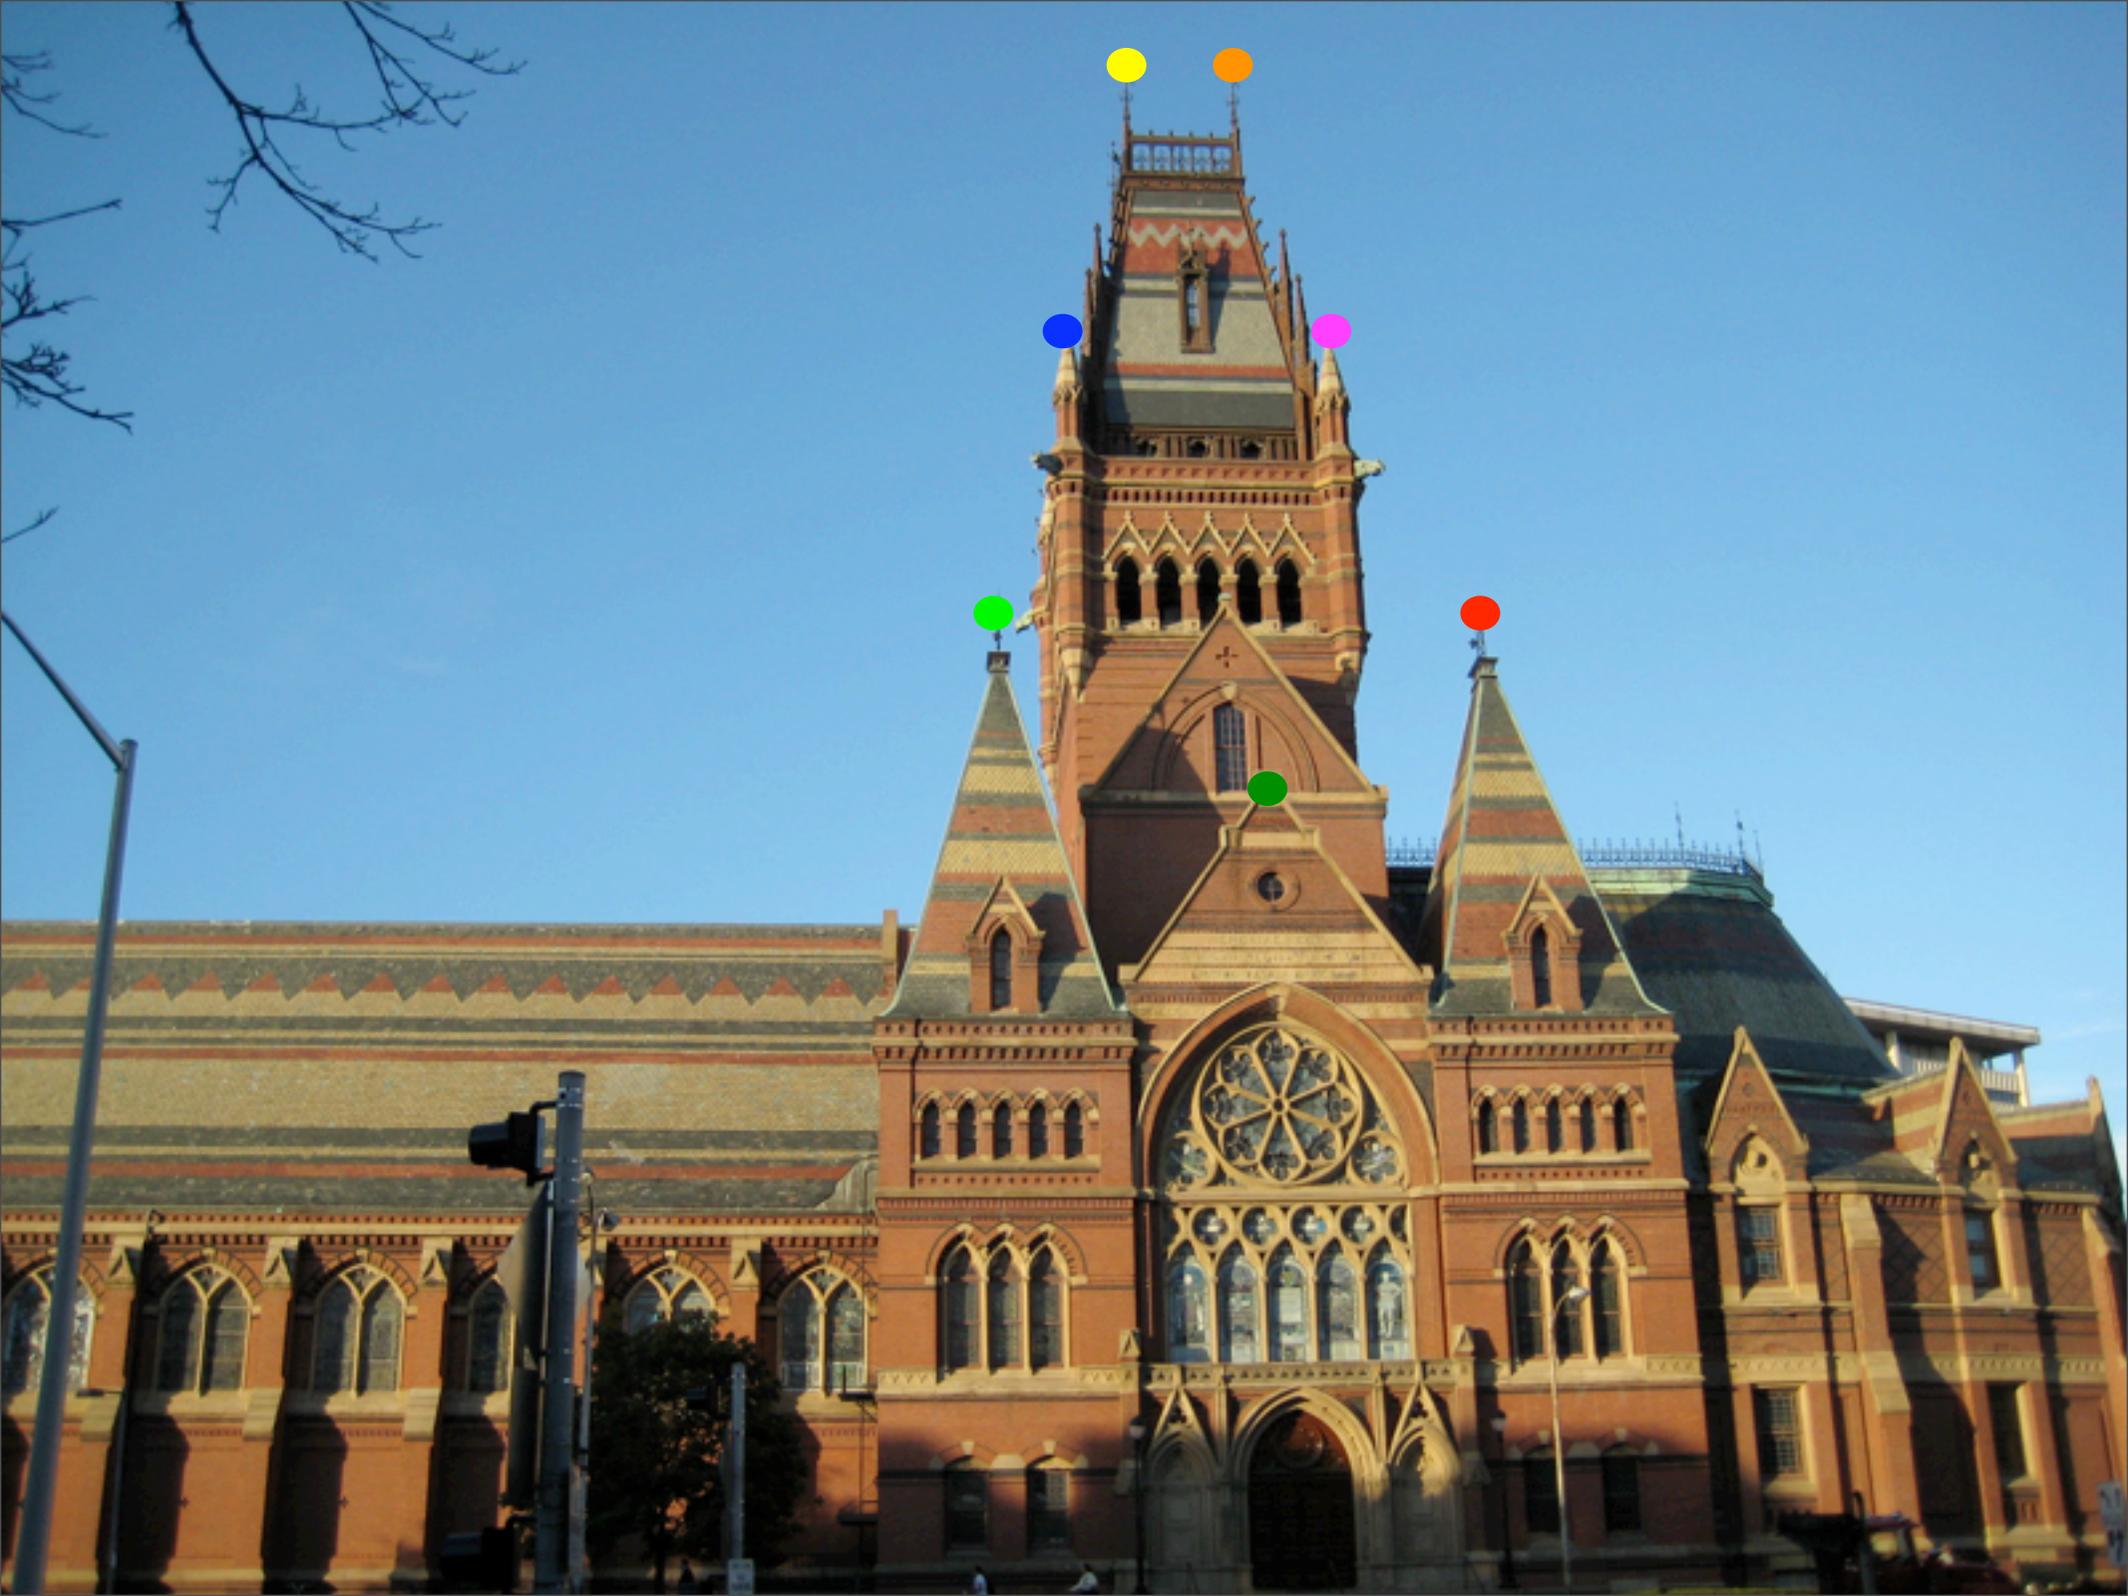

Given three photographs of an object. Can we reconstruct the points and the camera positions and parameters? How many points do we have to see? How do we reconstruct cameras and point positions?

\_\_\_\_\_

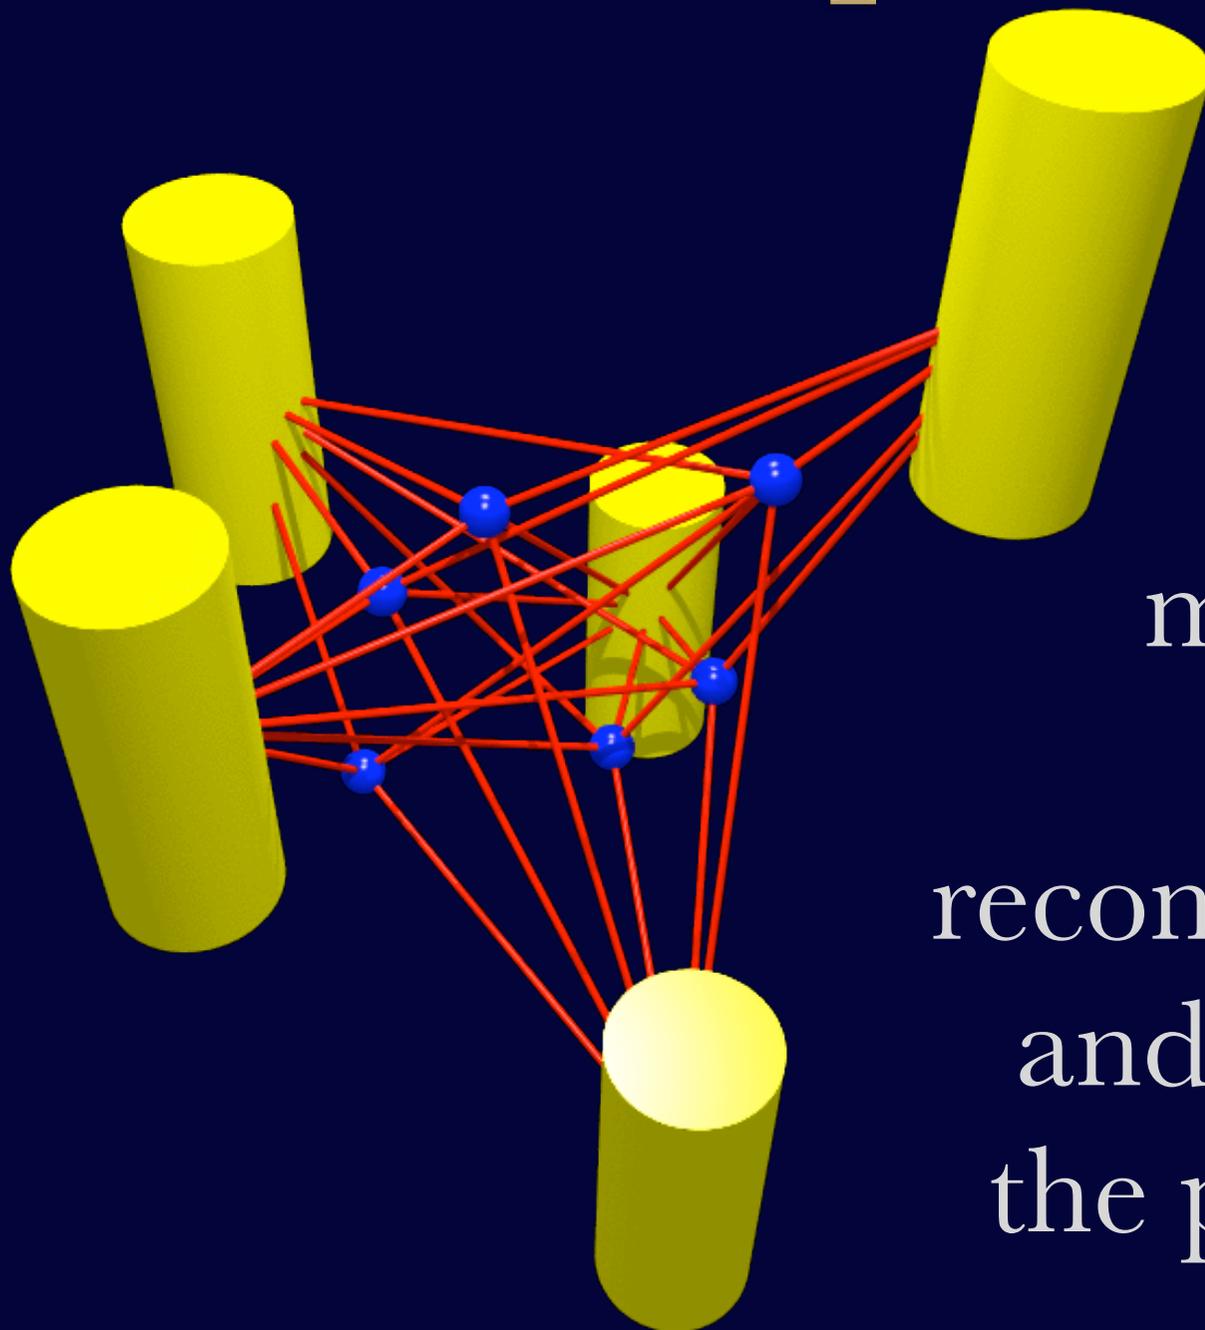

How much can  
we reconstruct from  
a movie with many  
frames?

in space

$m$  cameras

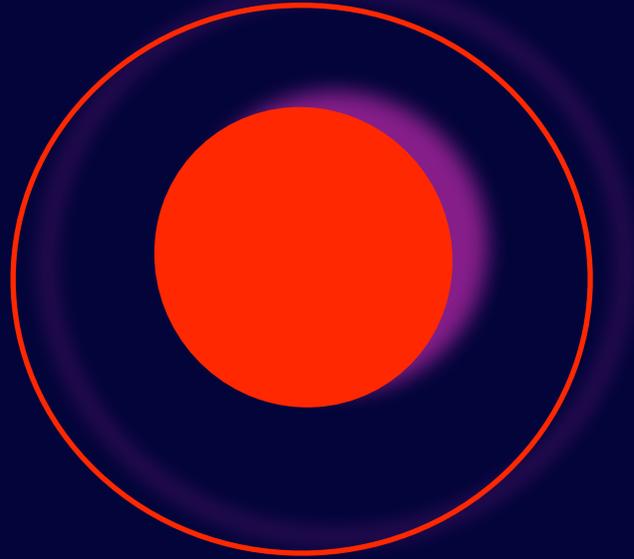

$n$  points

reconstruct camera

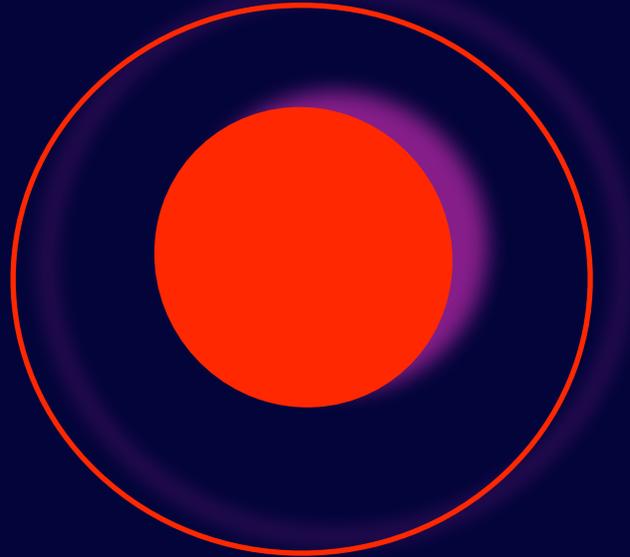

and points from  
the photographs.

Here is a  
Structure  
from Motion  
problem in 2D:

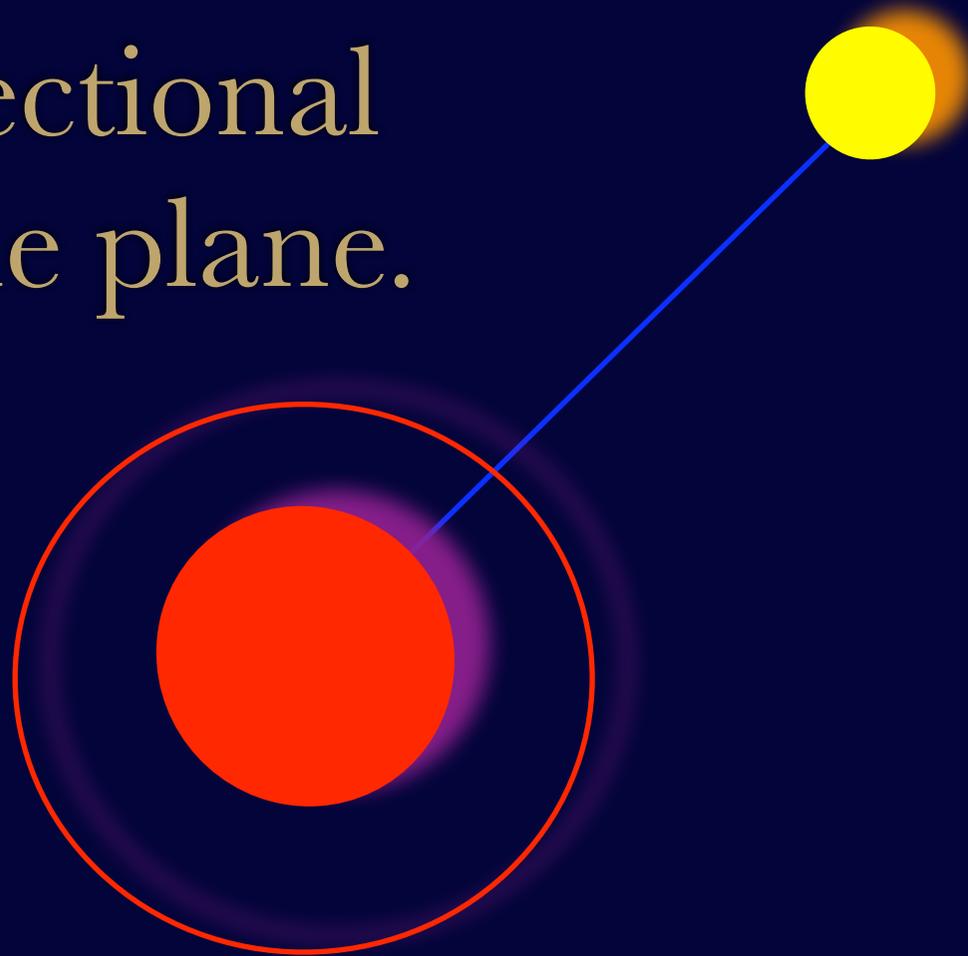

We assume  
an omnidirectional  
camera in the plane.

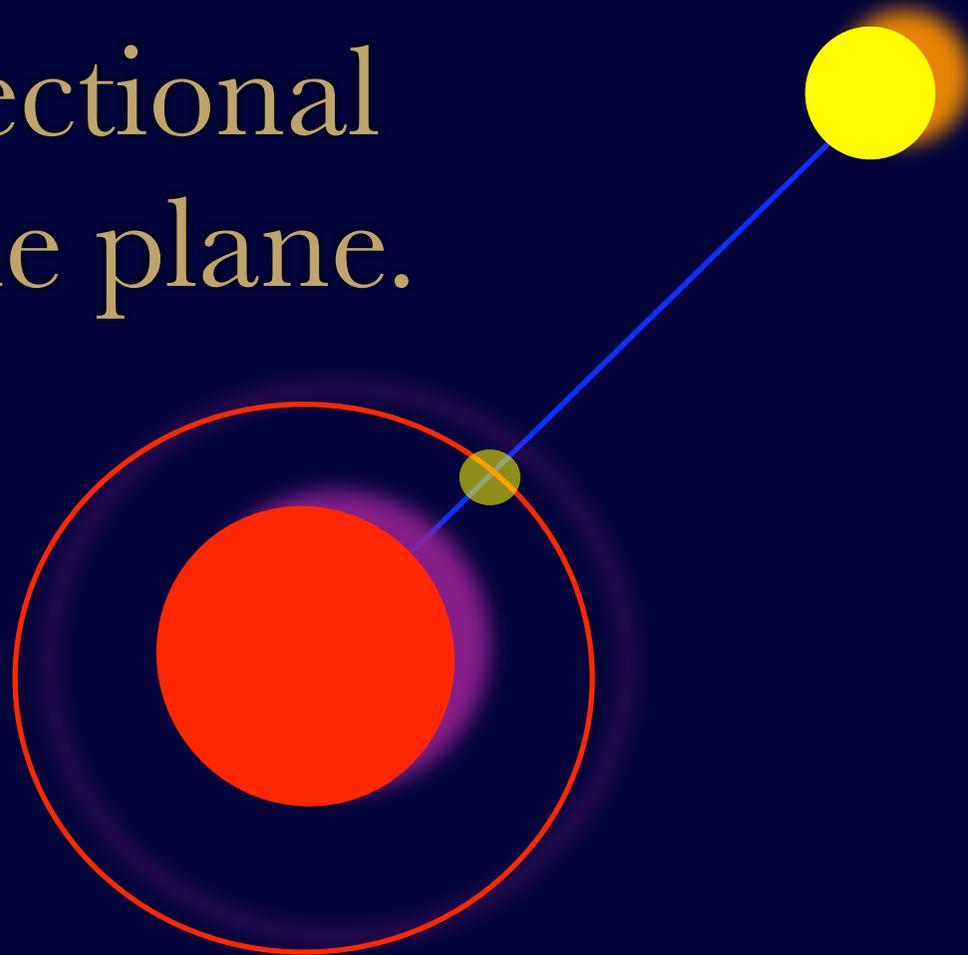

We assume  
an omnidirectional  
camera in the plane.

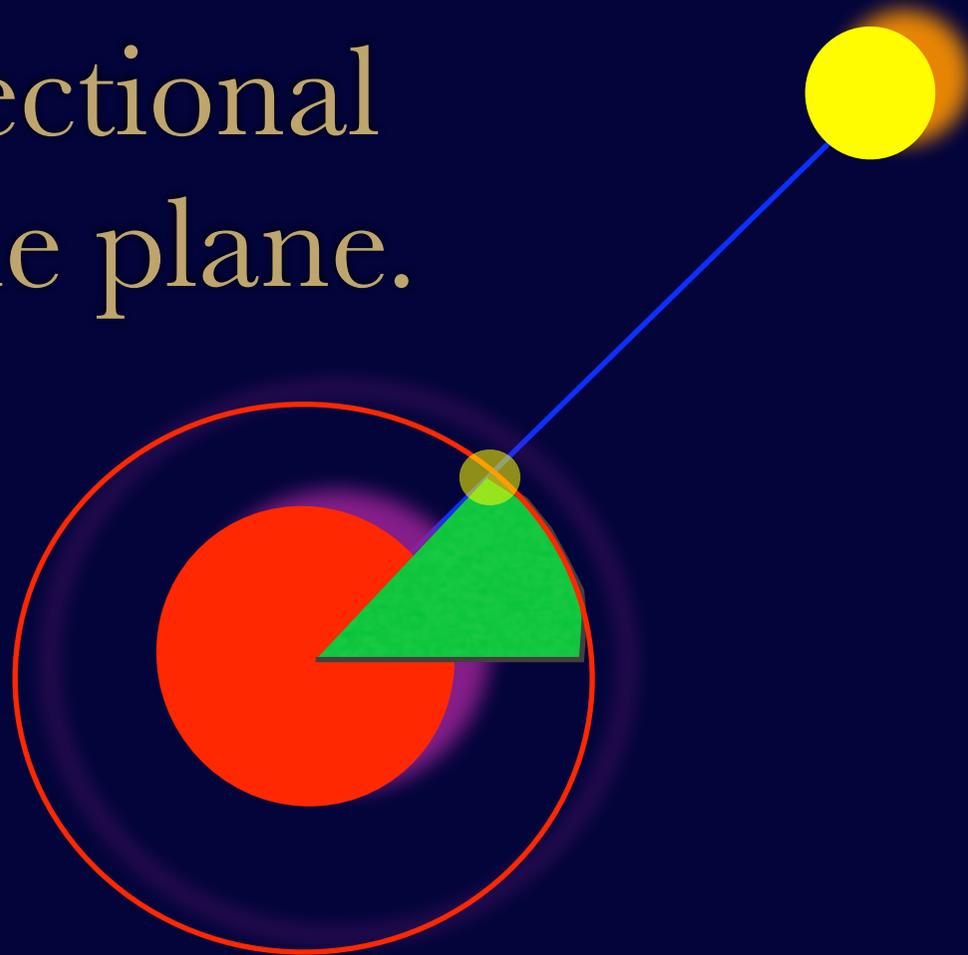

We assume  
an omnidirectional  
camera in the plane.

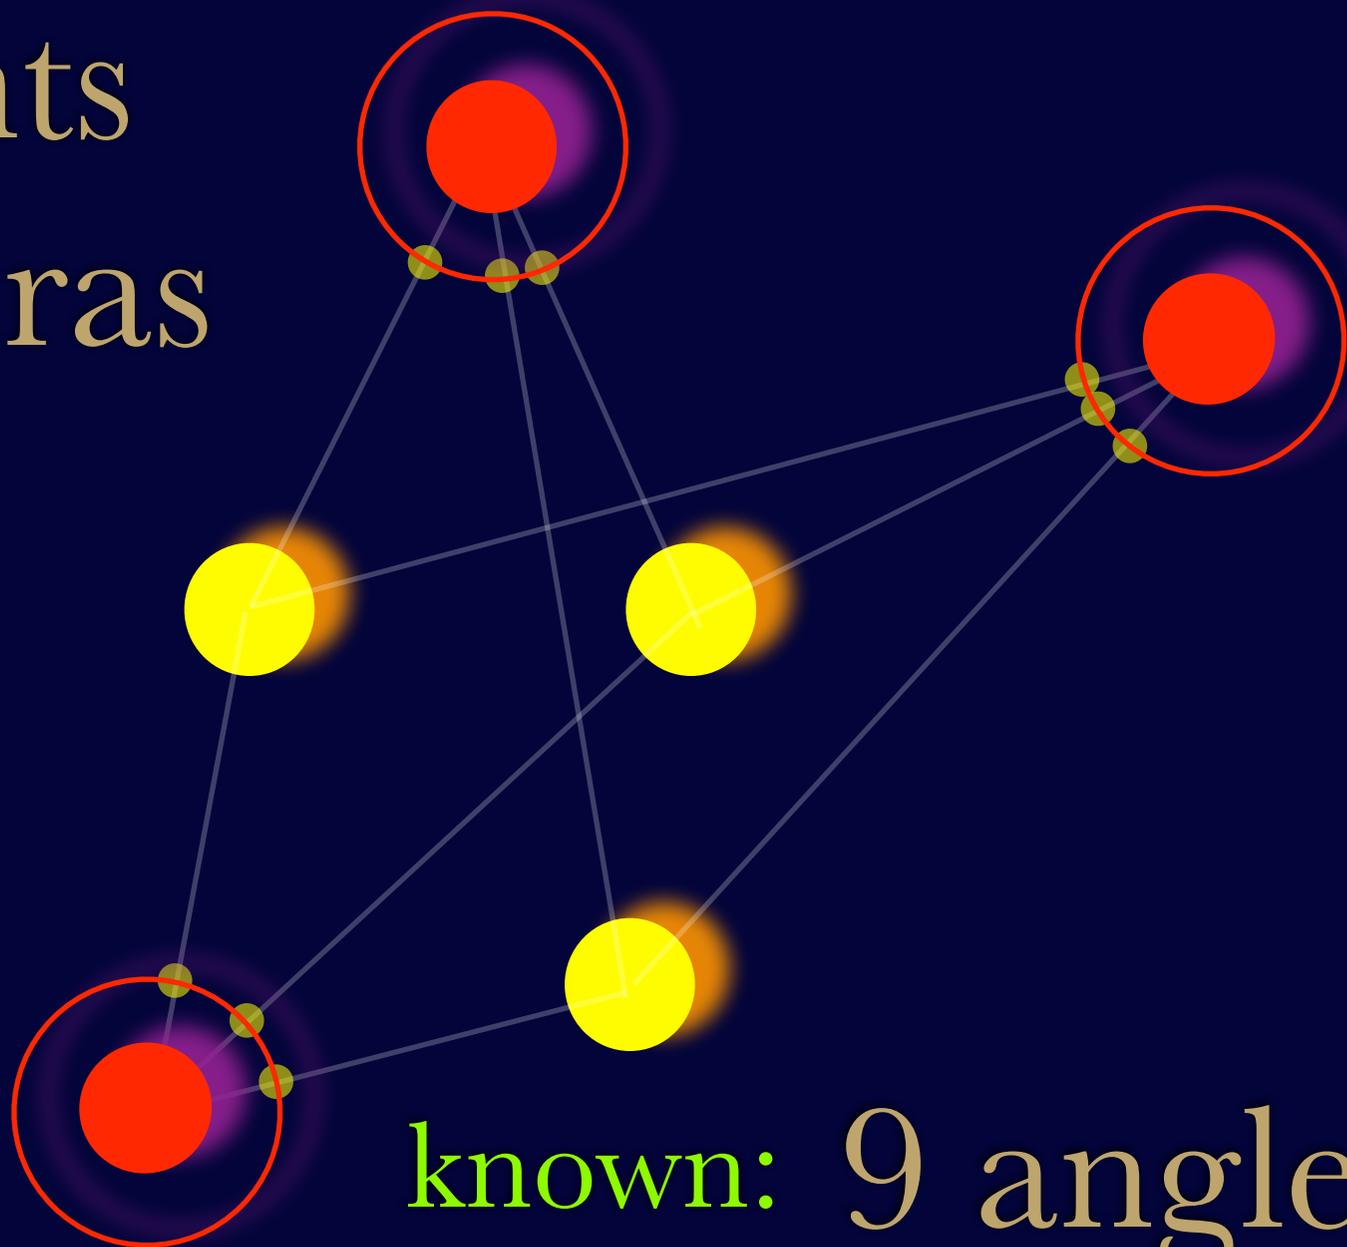

We assume  
an omnidirectional  
camera in the plane.

We assume  
an omnidirectional  
camera in the plane.

# Theorem (Knill-Ramirez)

In the plane, if the 3 omni cameras are noncollinear, the 3 points are noncollinear and the union of cameras and points is not contained in the union of two lines, then the structure of motion problem has a unique solution.

# lemmas:

fixed point

deformable point

1. the problem is linear. The space of possible solutions is an affine linear space.
2. if three cameras are fixed, then every point has to fixed.
3. if three points are fixed, then every camera has to fixed.

# lemmas:

Proof:

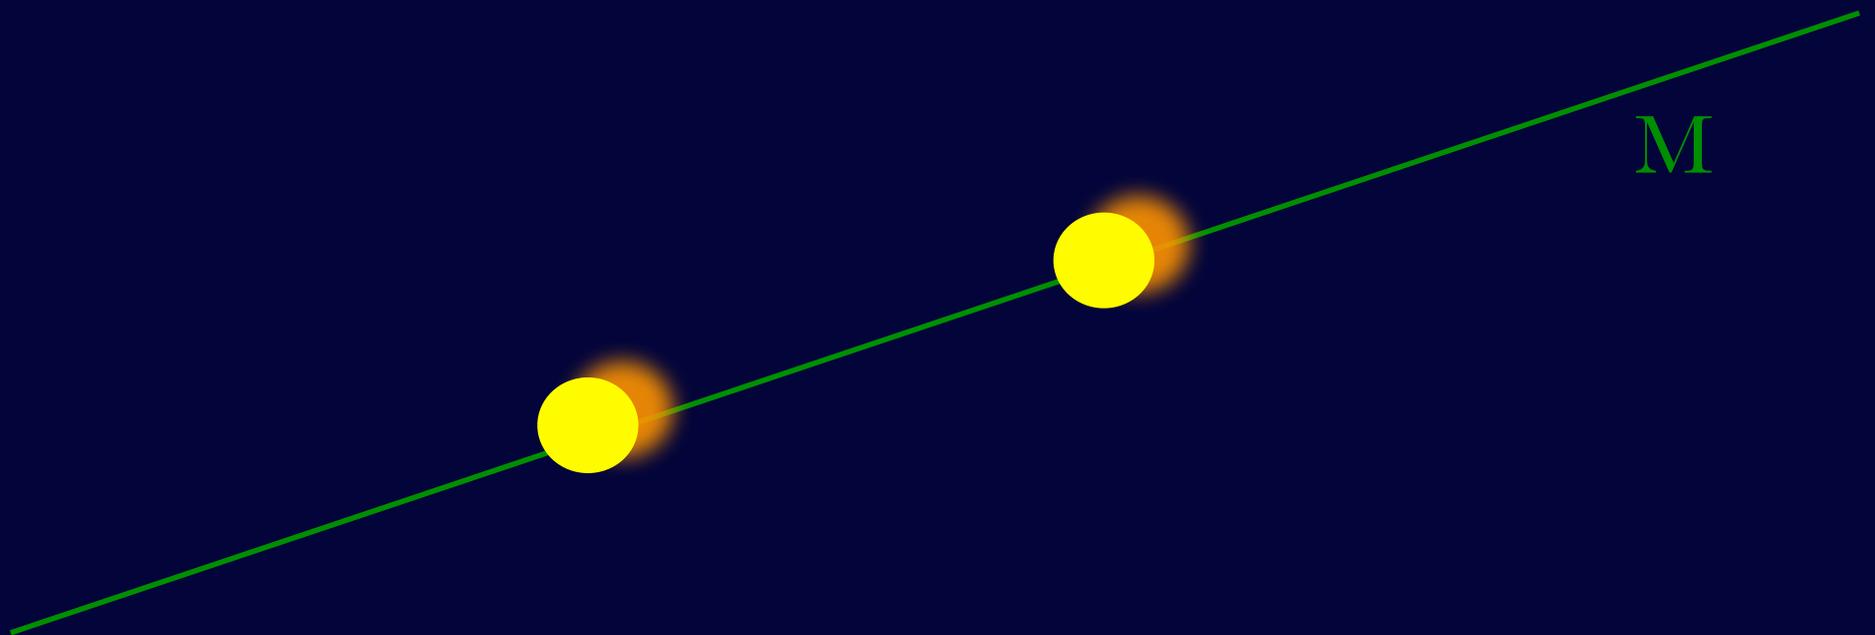

Proof:

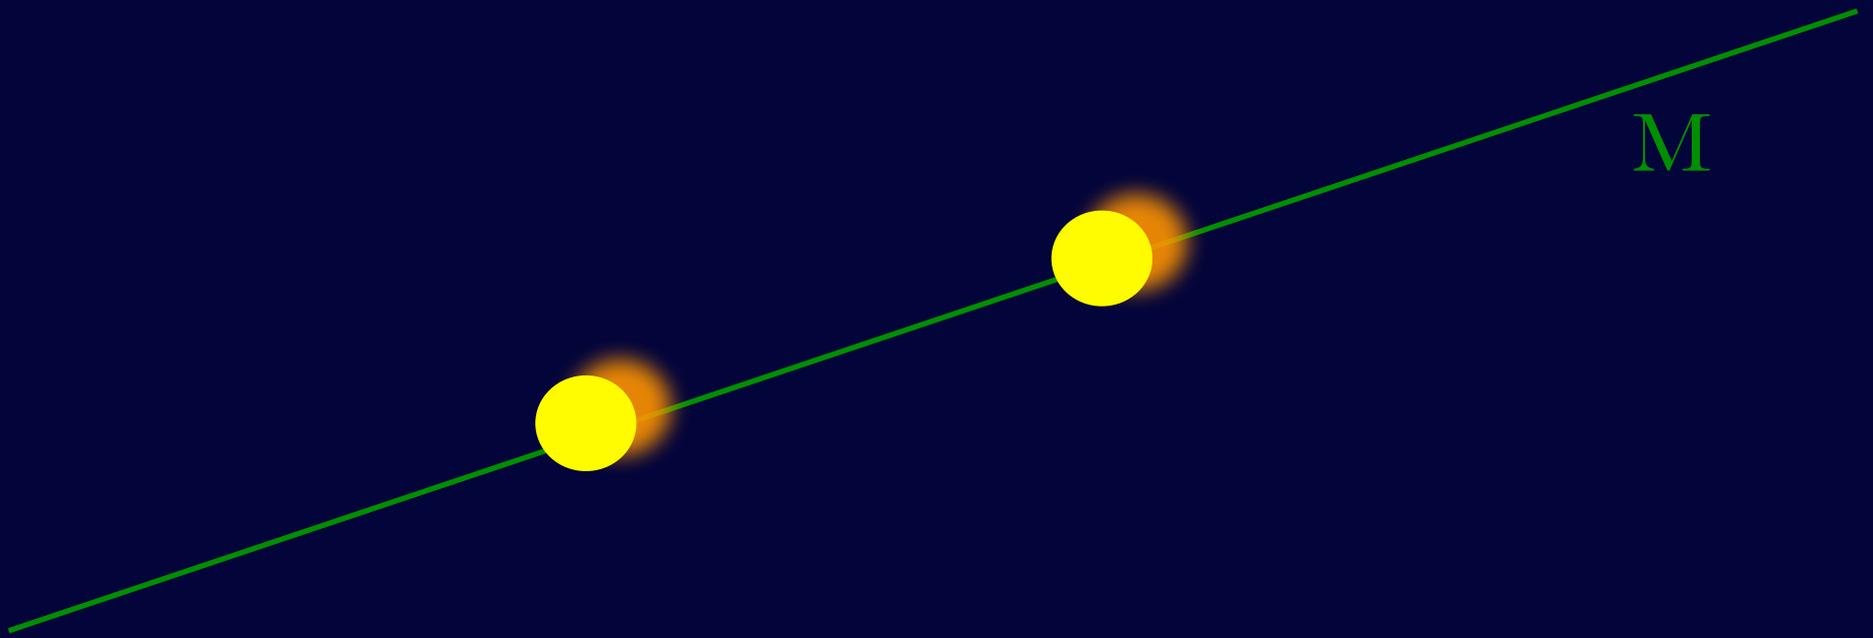

Proof:

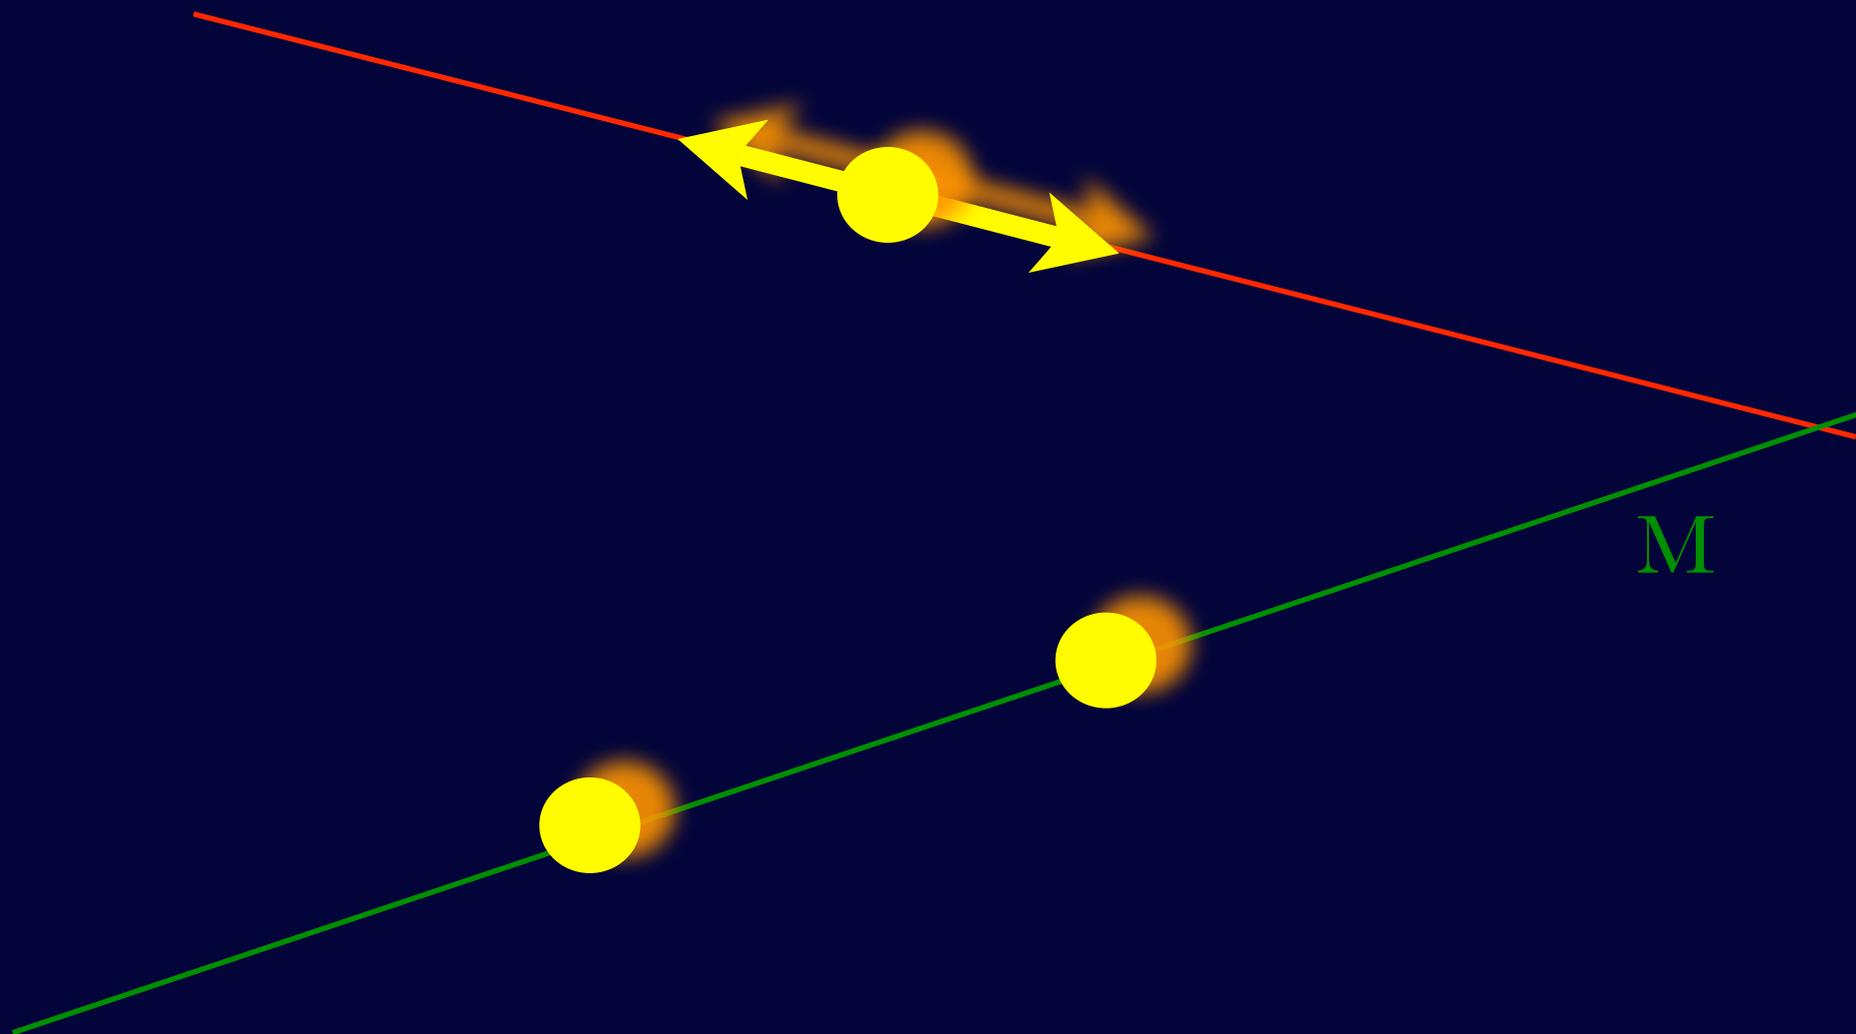

Proof:

# Desargues:

if two cameras  
and two points  
deform, then  
the deformation  
lines go through a  
point and force  
the cameras onto  
a line.

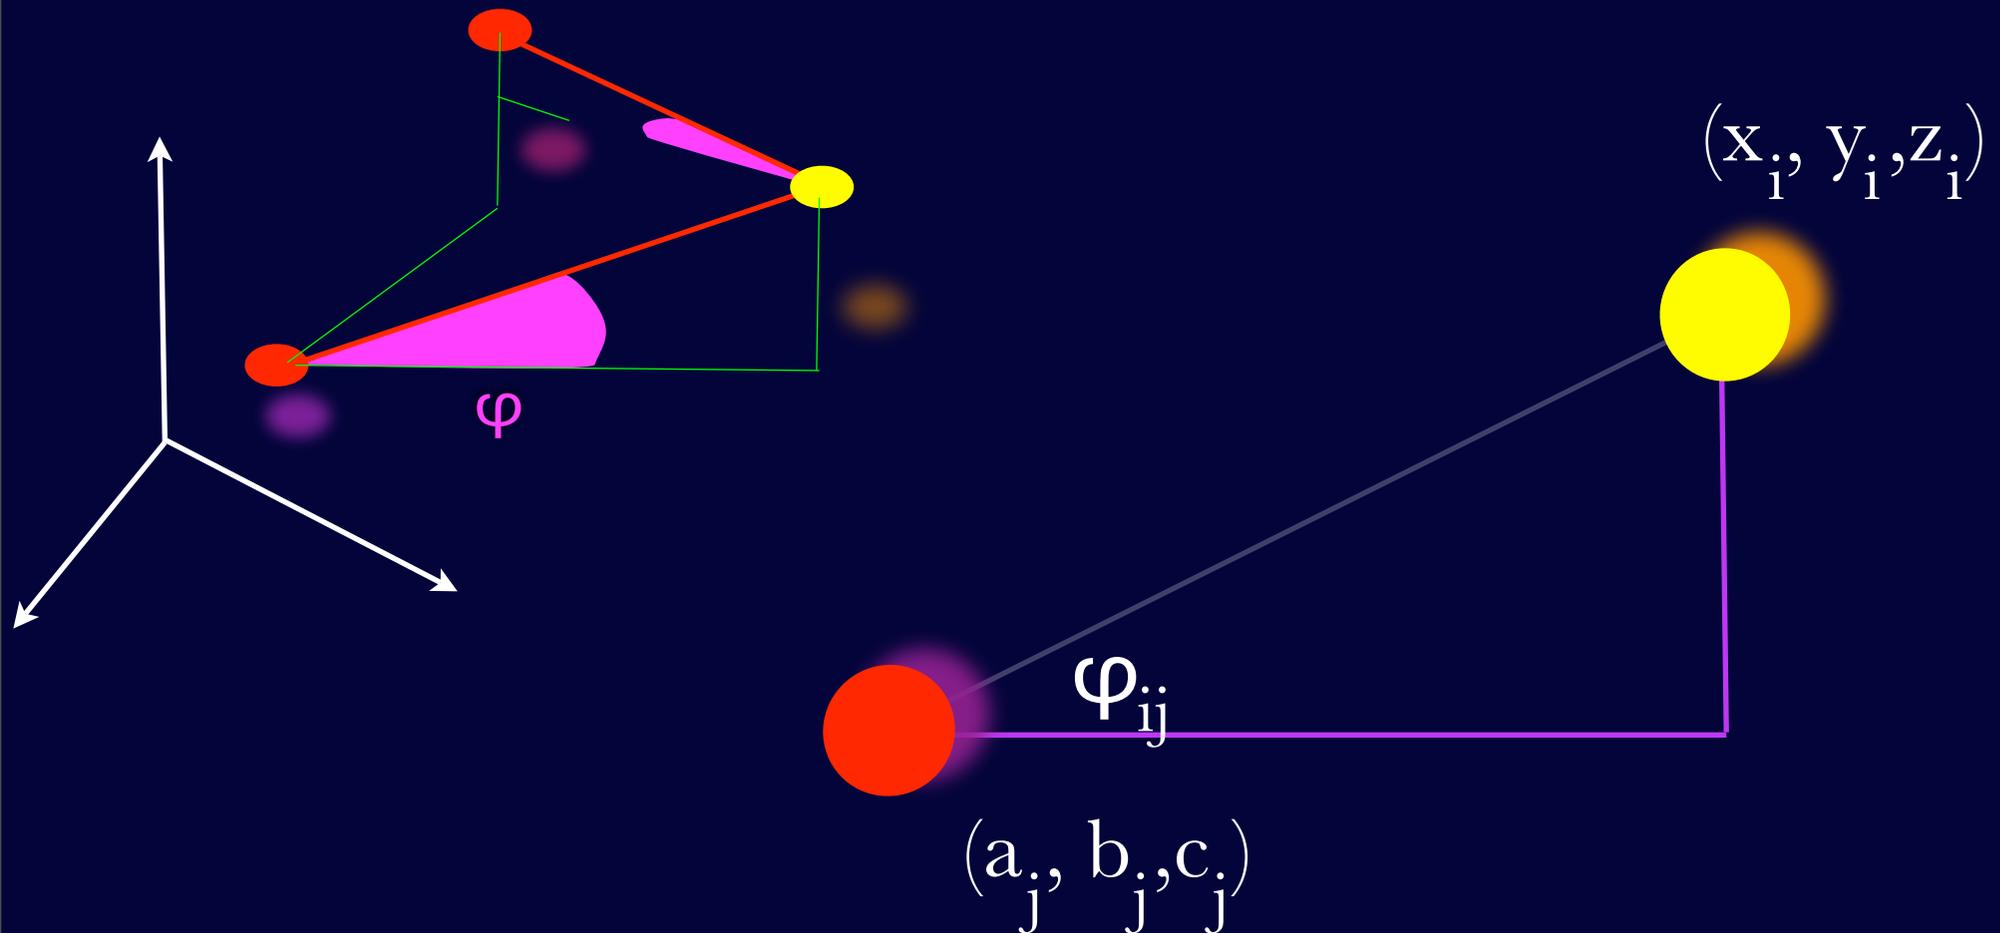

# Spherical camera

An omnidirectional camera needs 6 parameters. If the orientation is known, then only 3 parameters are needed: the position

# From the plane to space:

we know the  $(x,y)$  coordinates already.  
we can get the  $z$  coordinates from the angle  $\varphi$

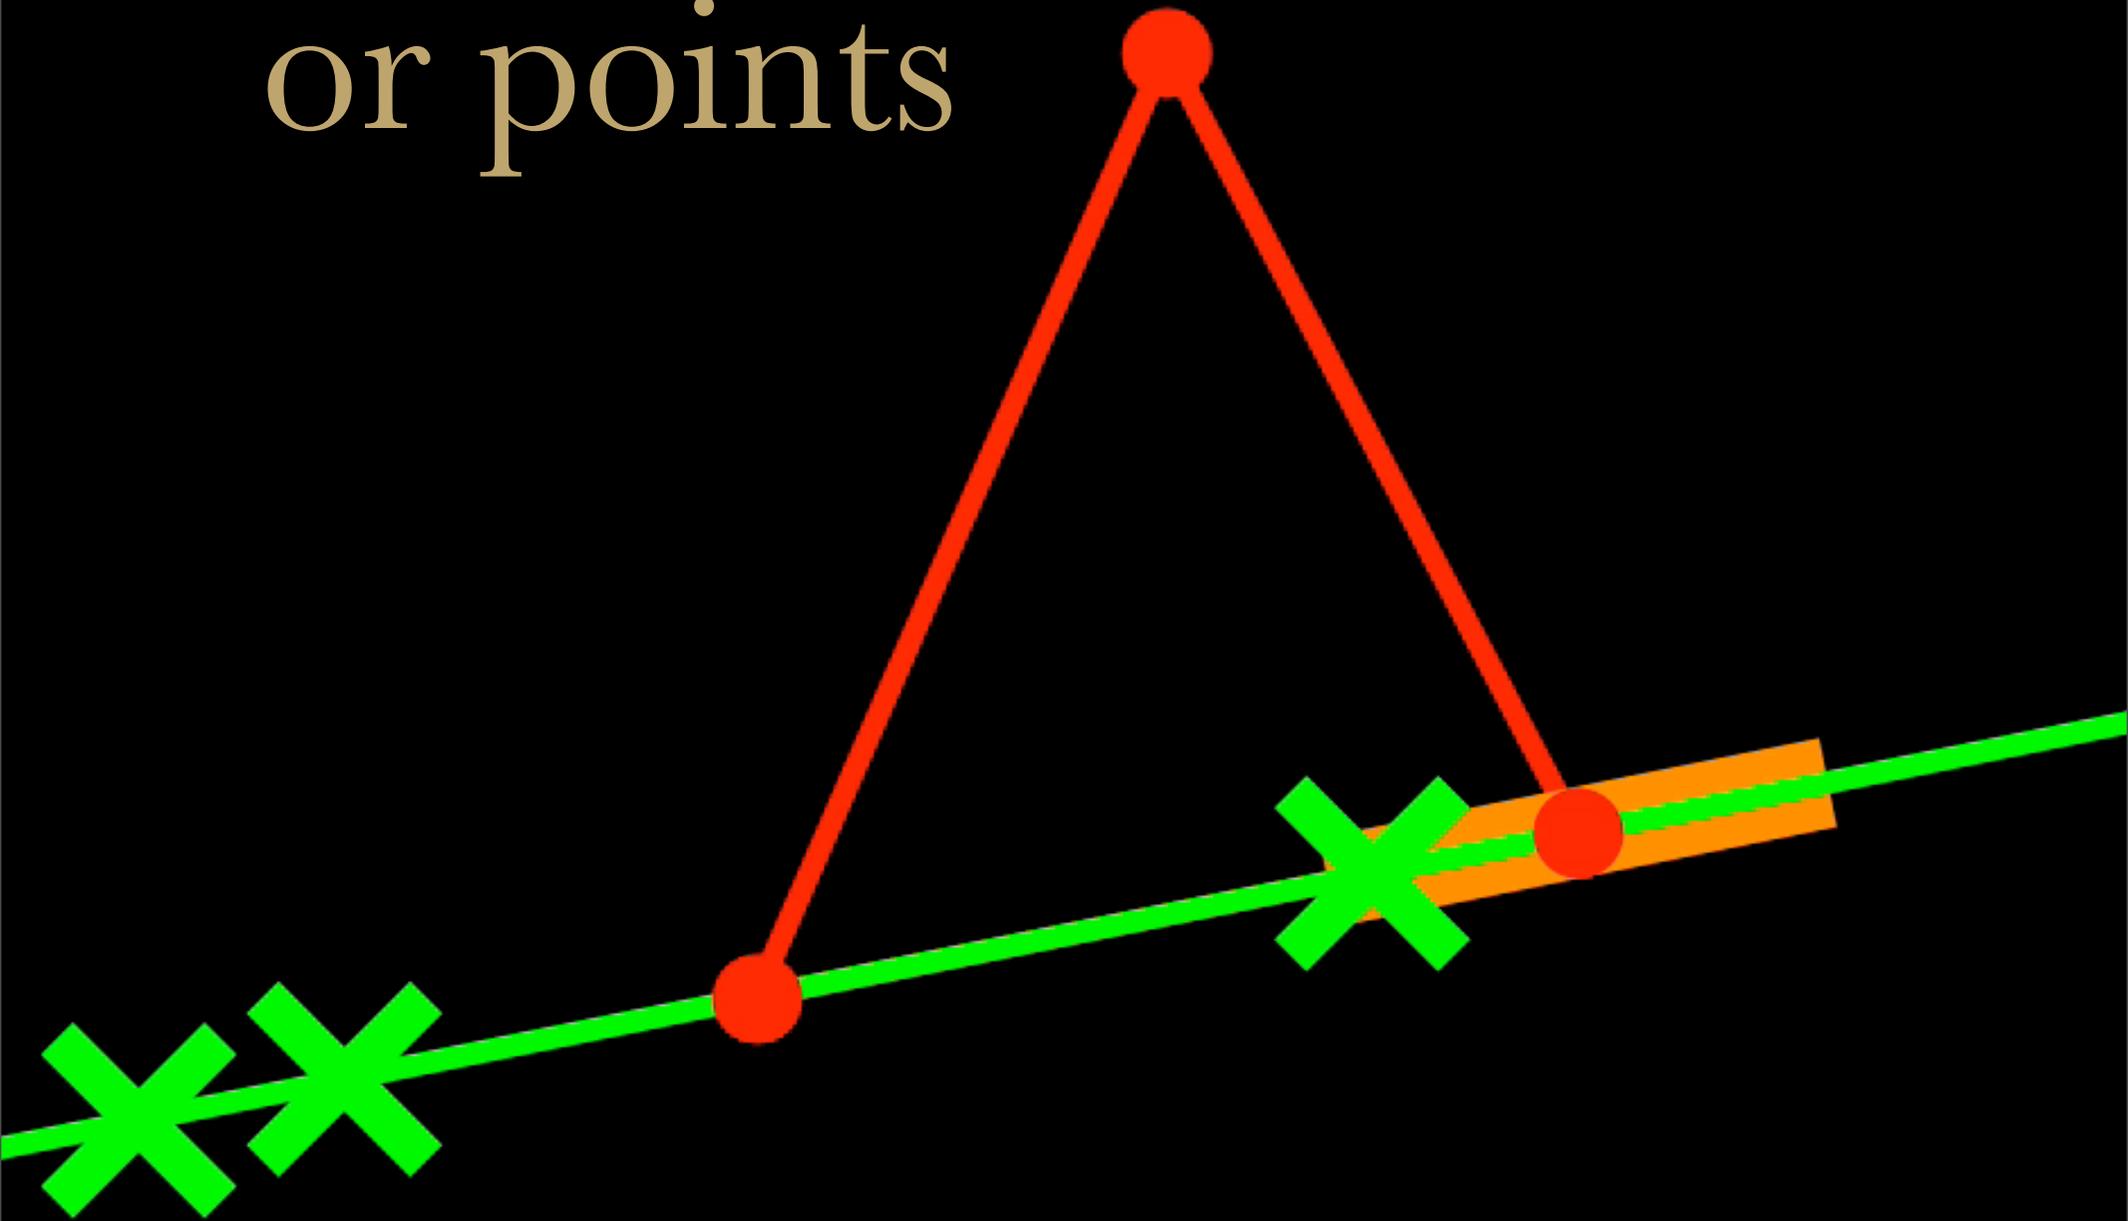

The result is

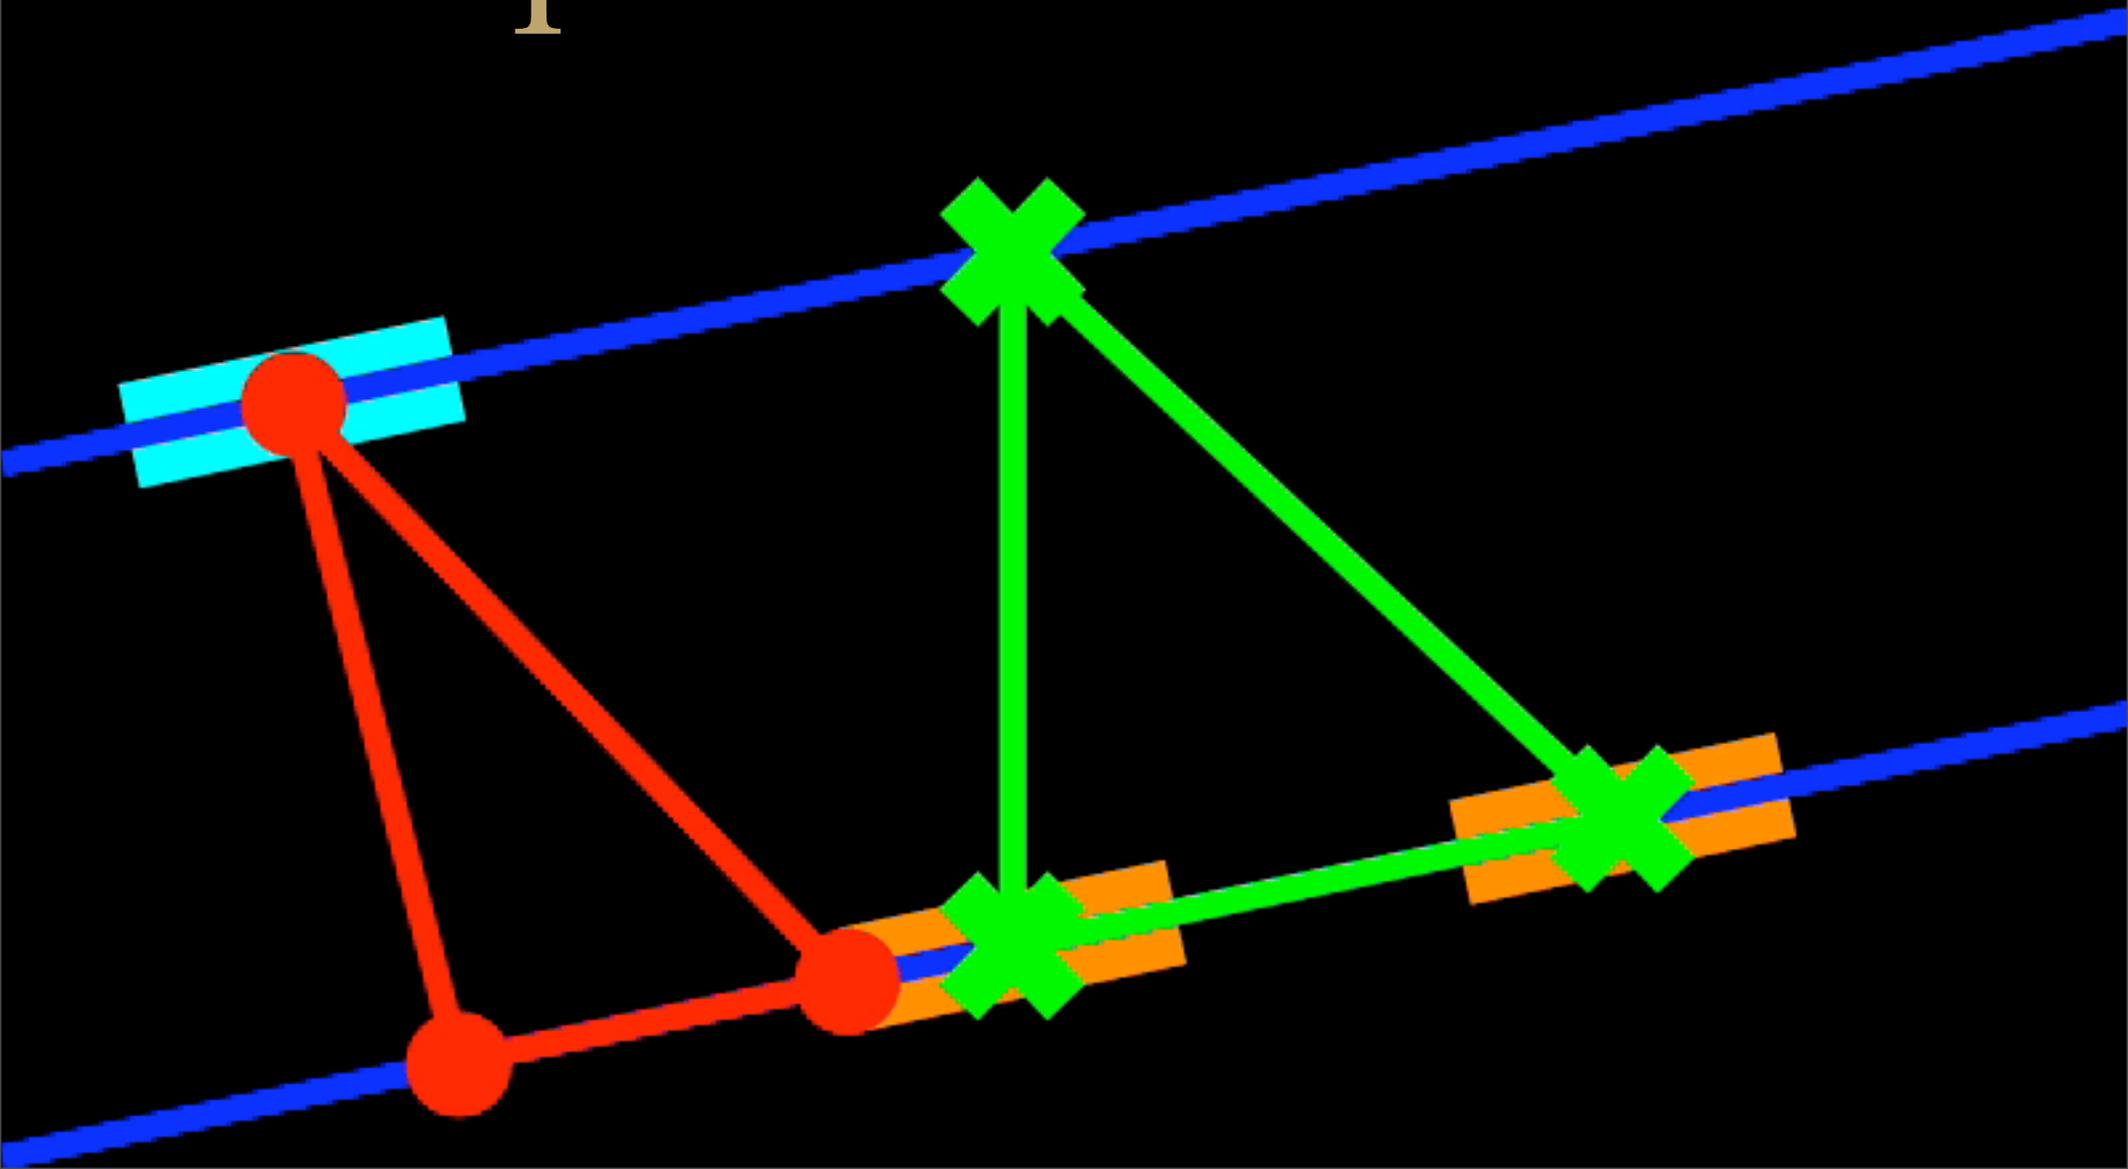

sharp

Examples:

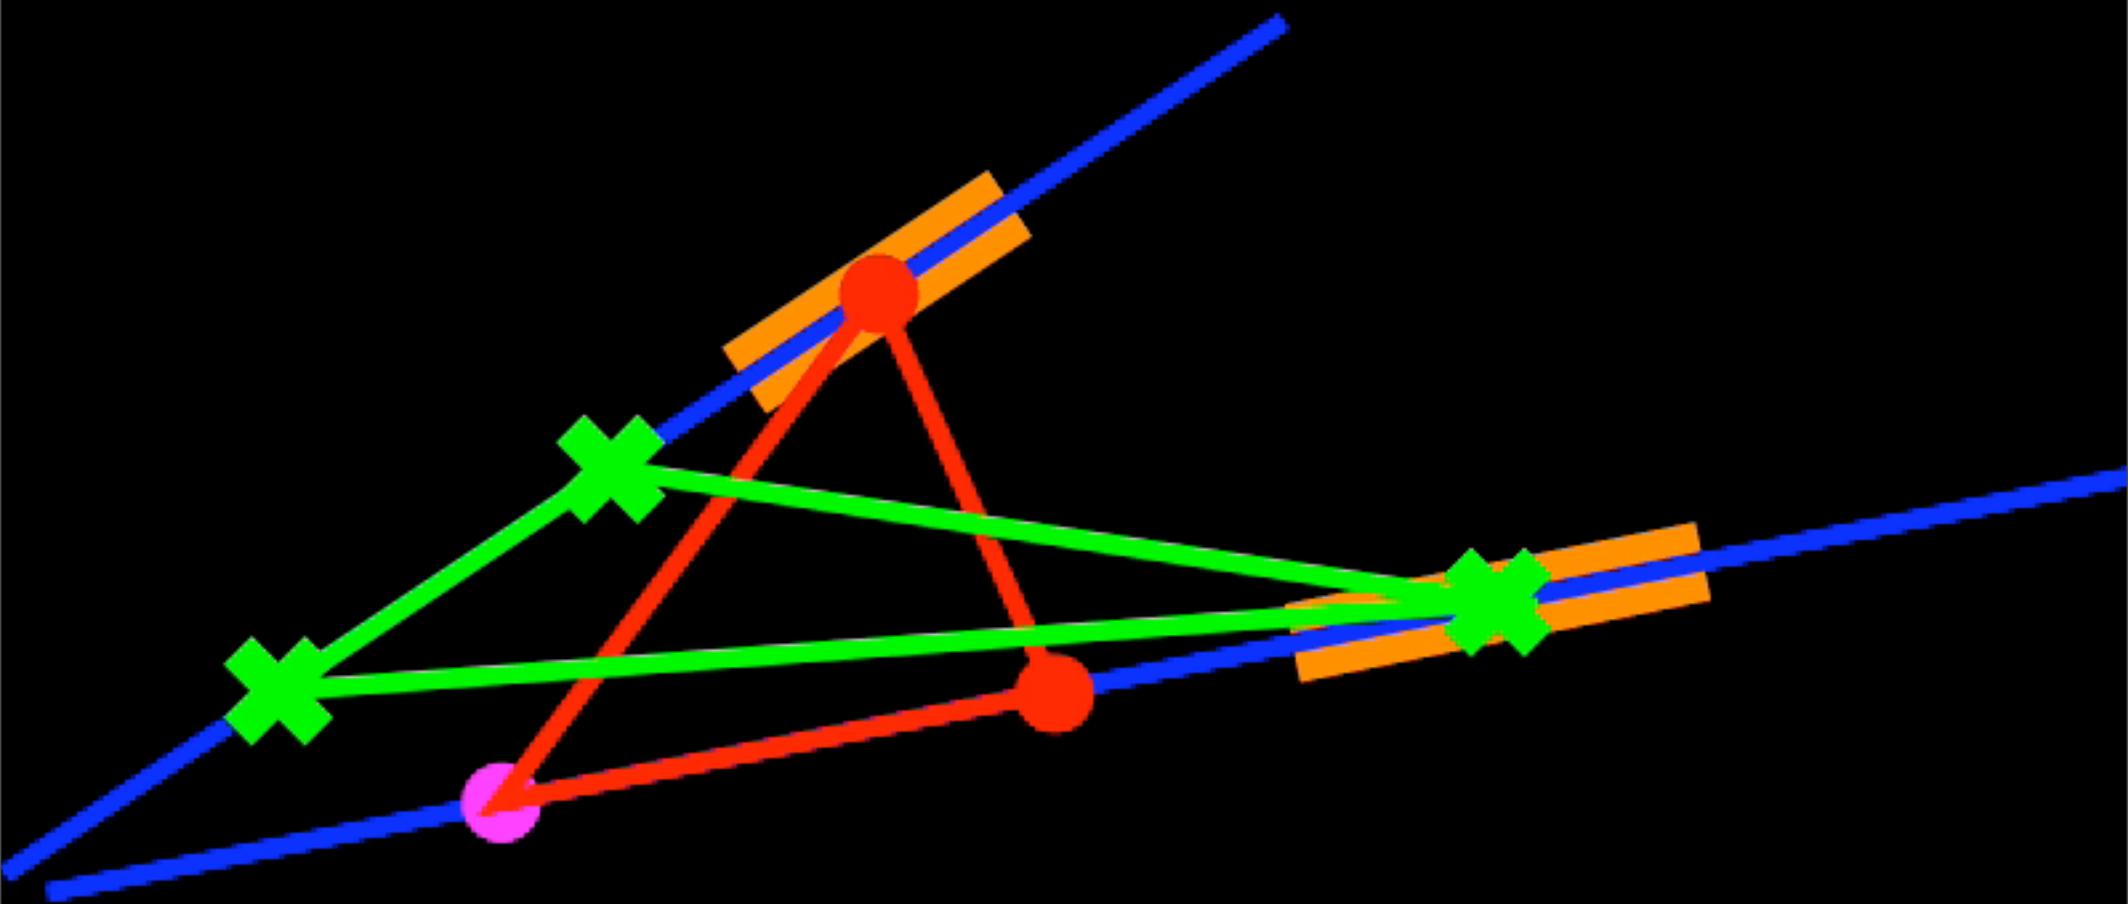

collinear cameras  
or points

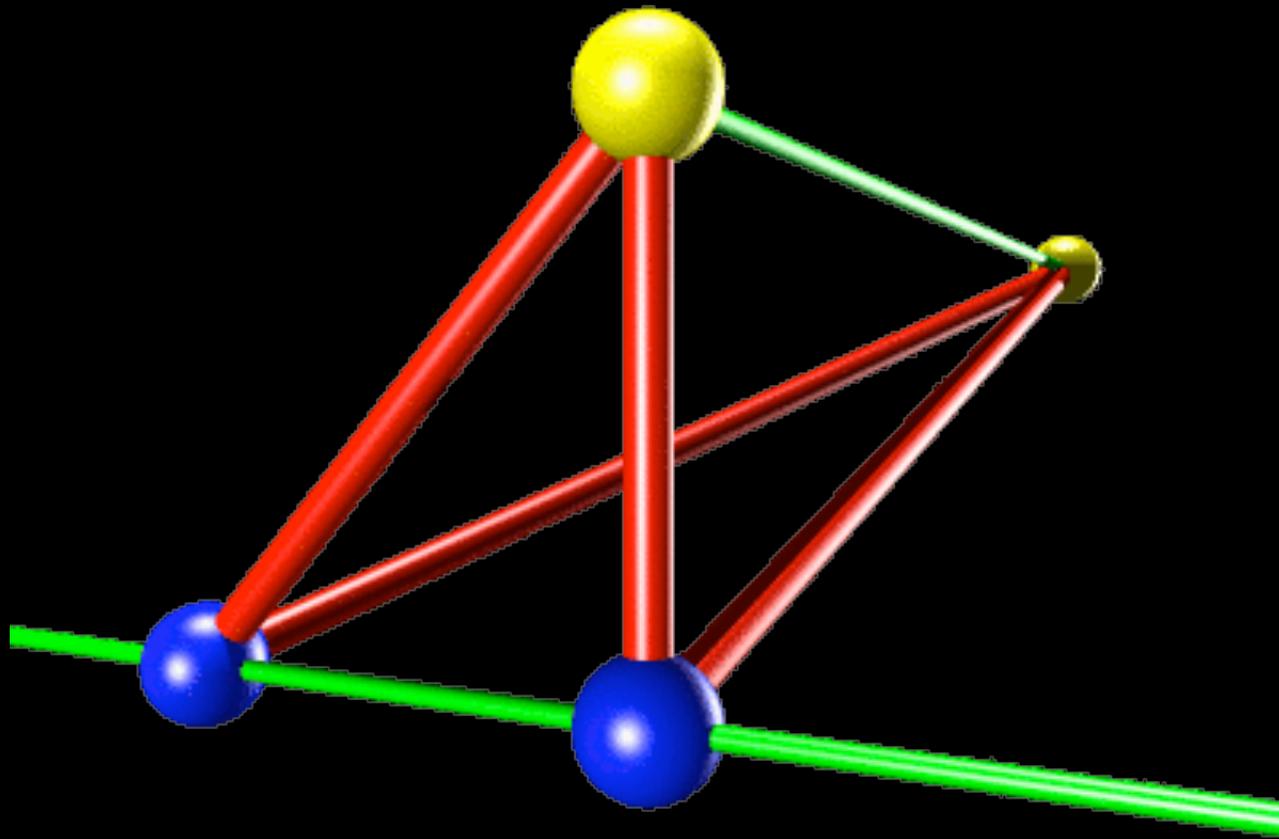

# Union of two parallel lines

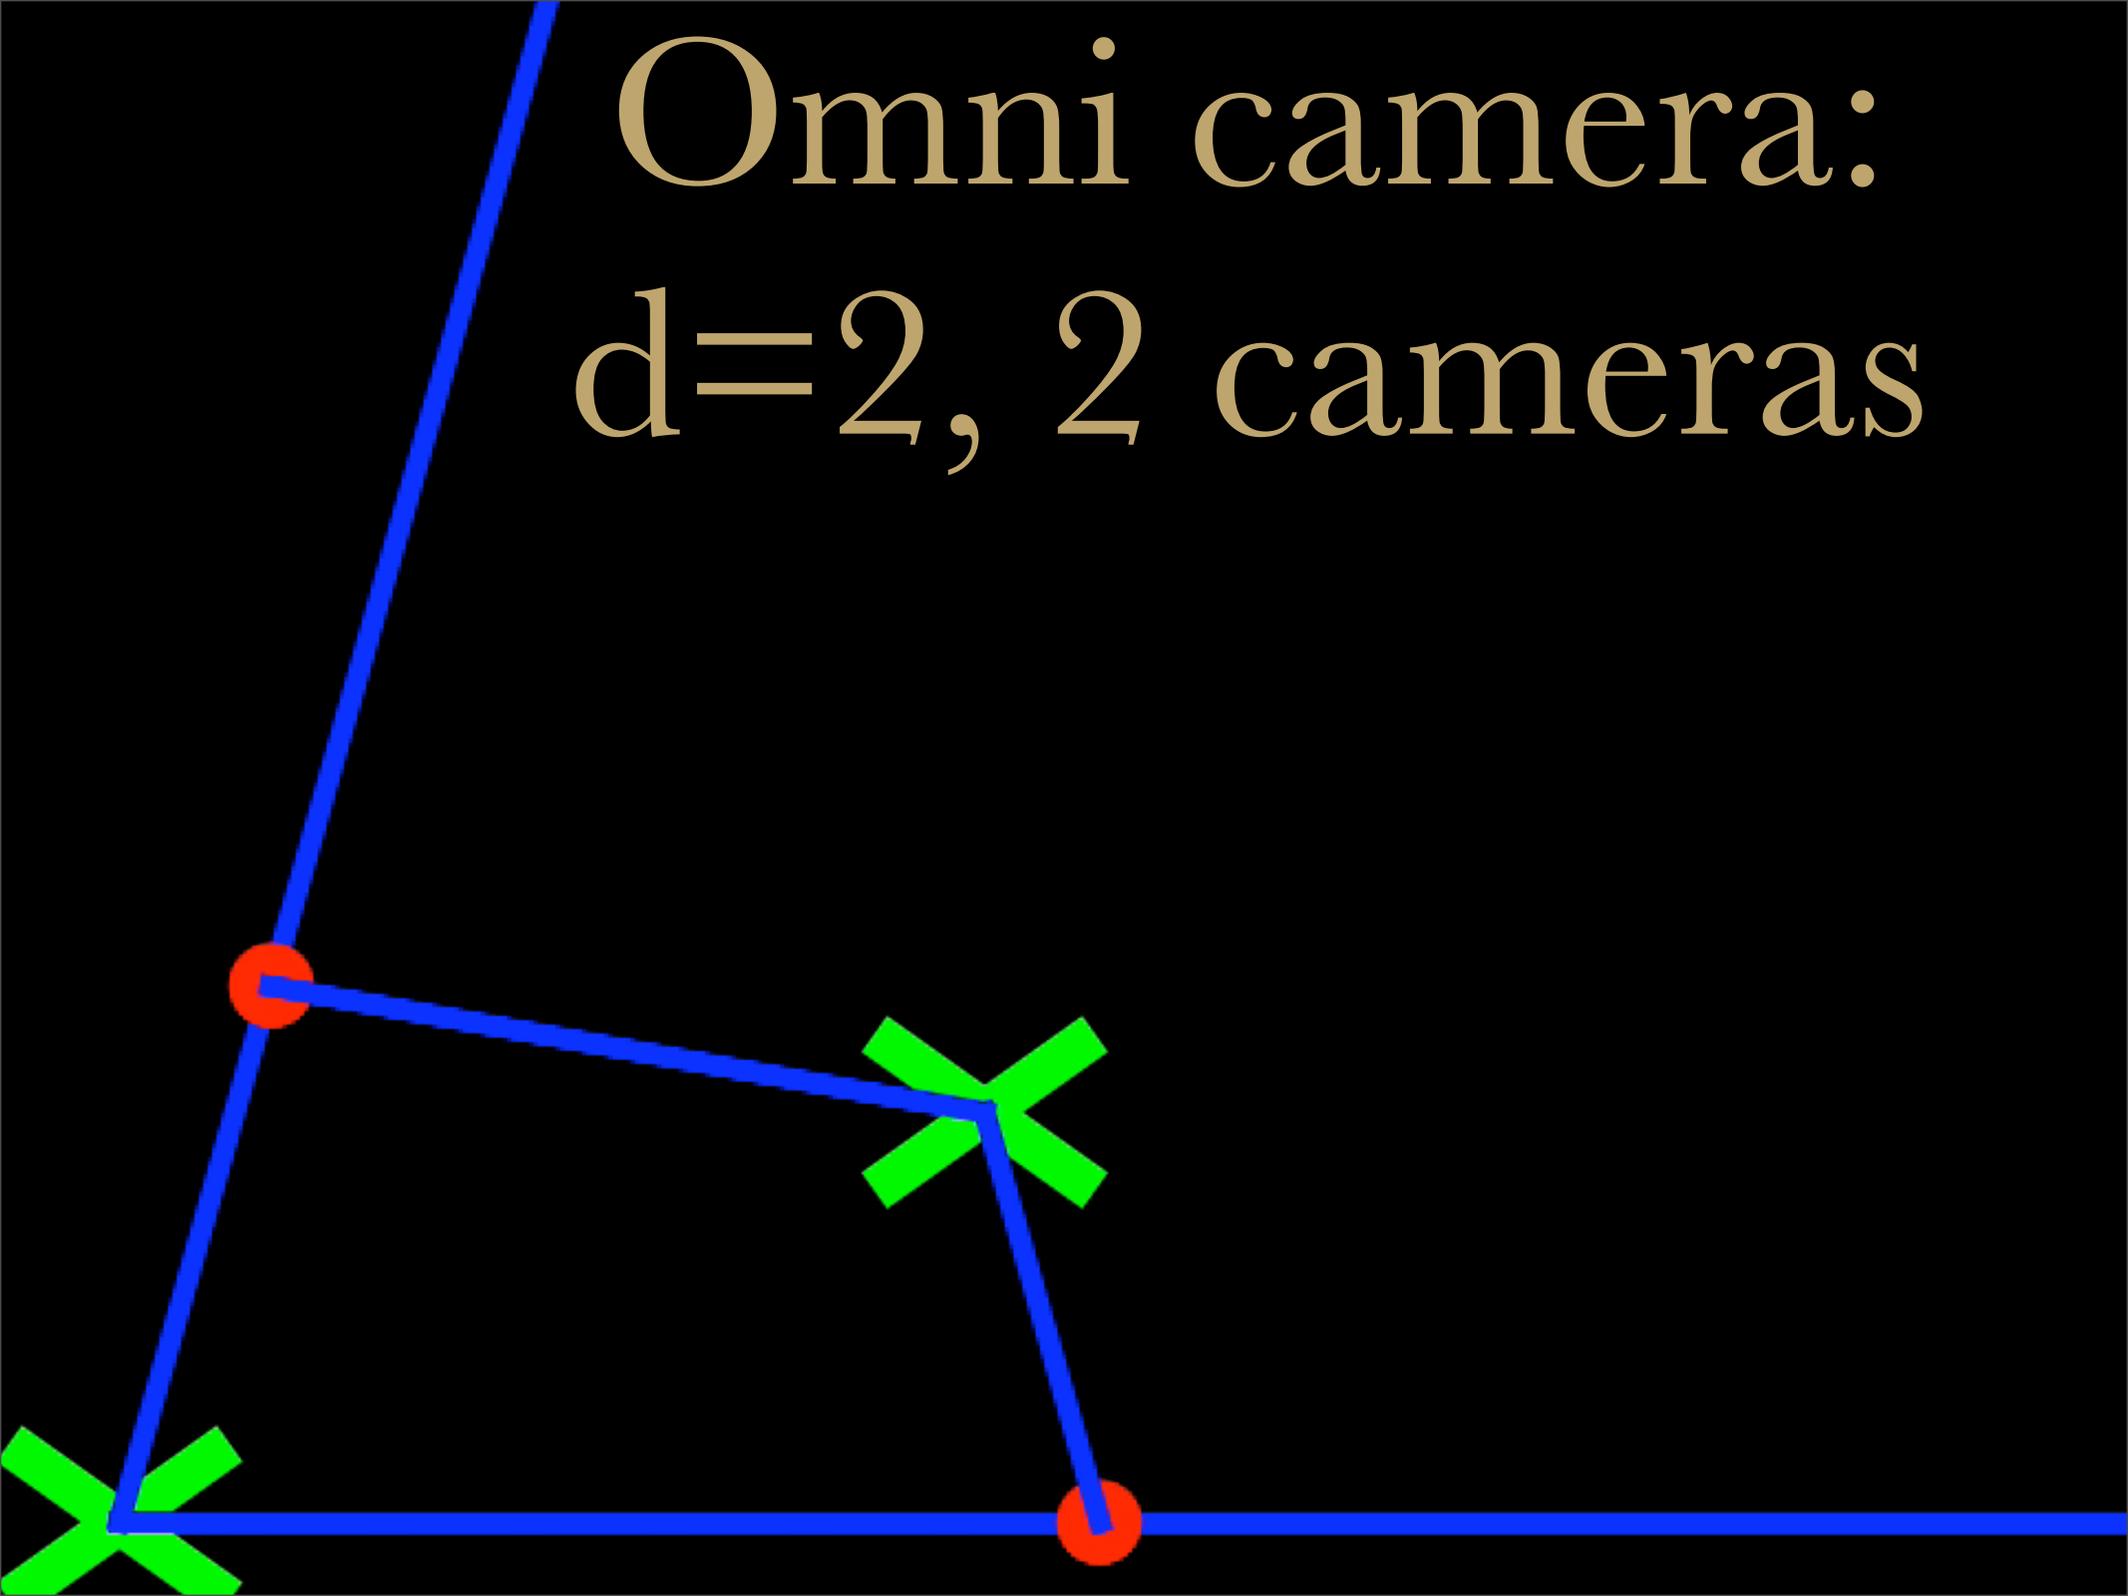

# Union of two lines

Omni: $d=3, m=2, n=2$

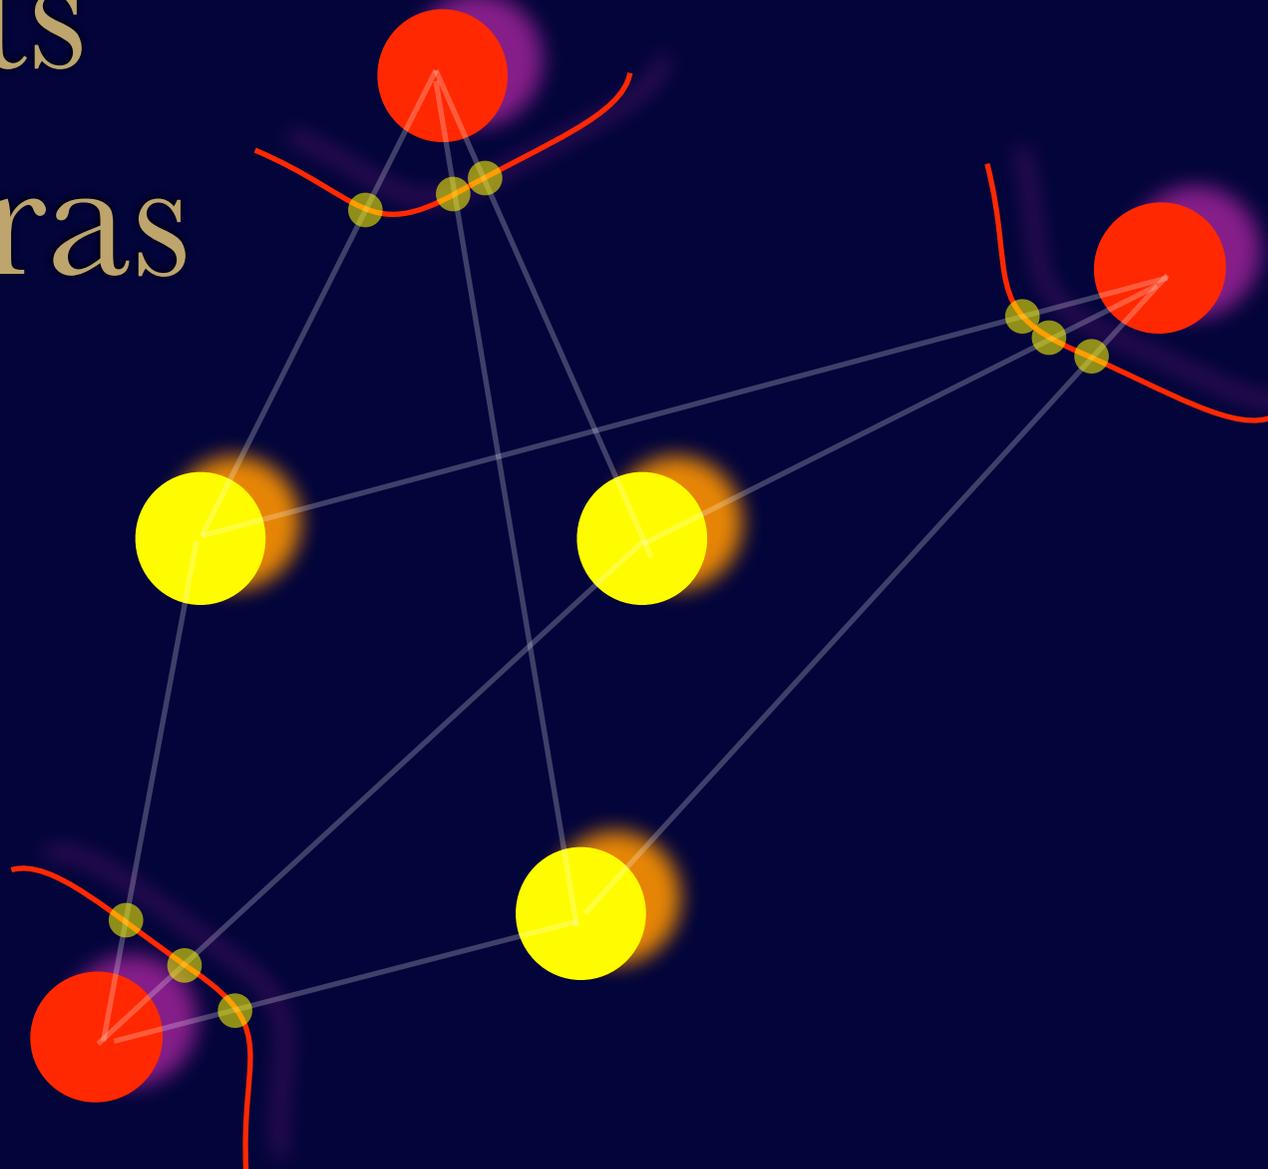

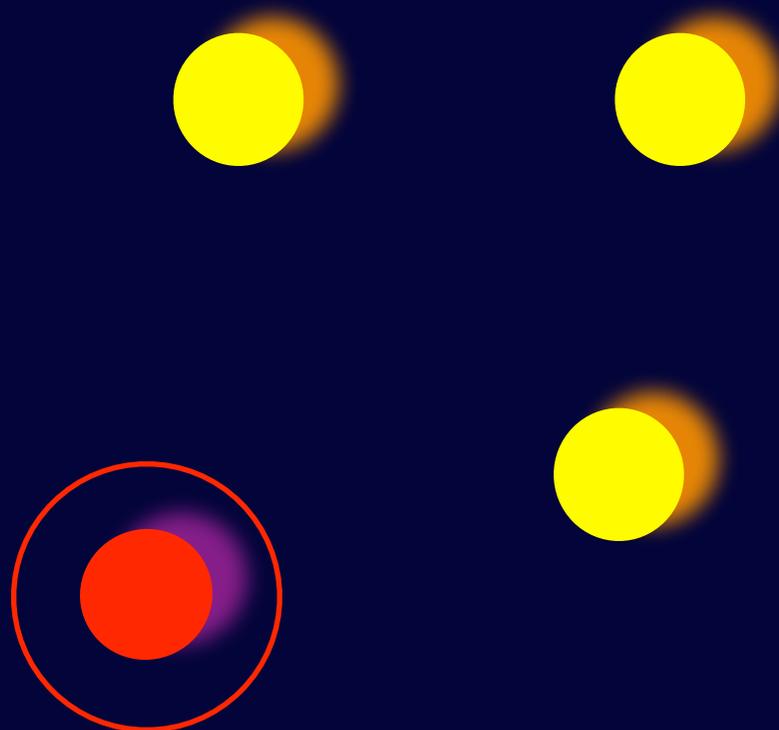

Omni camera:  
 $d=2$ , 2 cameras

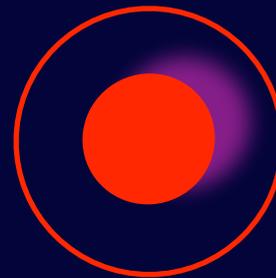

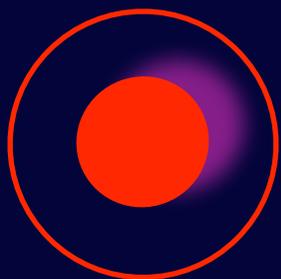

There are two  
point of views for  
the SFM  
problem:

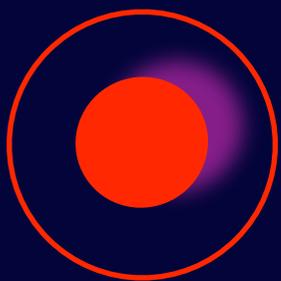

n points  
m cameras

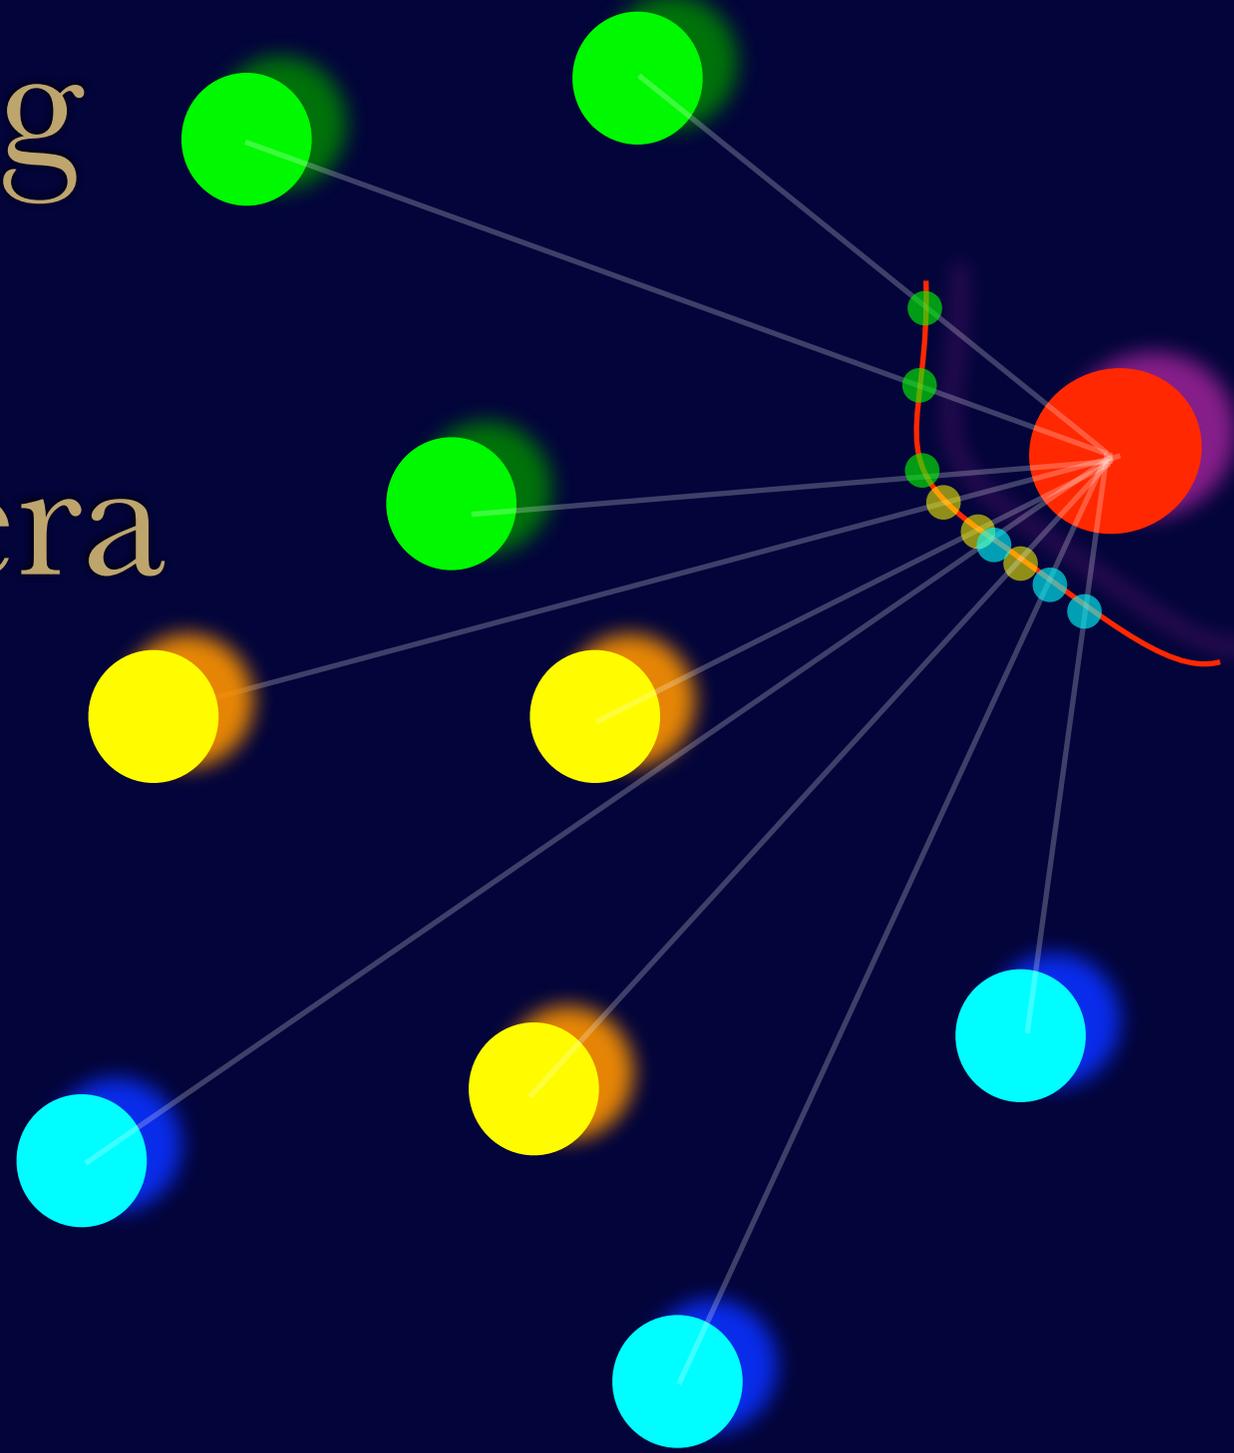

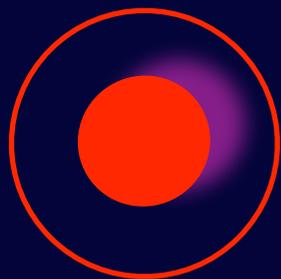

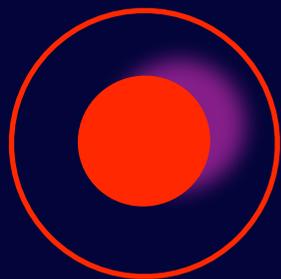

n moving  
points  
one camera

Reconstruction  
with many  
points  
and cameras

$$\sin(\alpha_{11})(x_1 - a_2) = \cos(\alpha_{11})(y_1 - b_1)$$

$$\sin(\alpha_{12})(x_1 - a_2) = \cos(\alpha_{12})(y_1 - b_2)$$

⋮

$$\sin(\alpha_{nm})(x_n - a_m) = \cos(\alpha_{nm})(y_n - b_m)$$

$$x_1 = 0$$

$$y_1 = 0$$

$$x_2 = 1$$

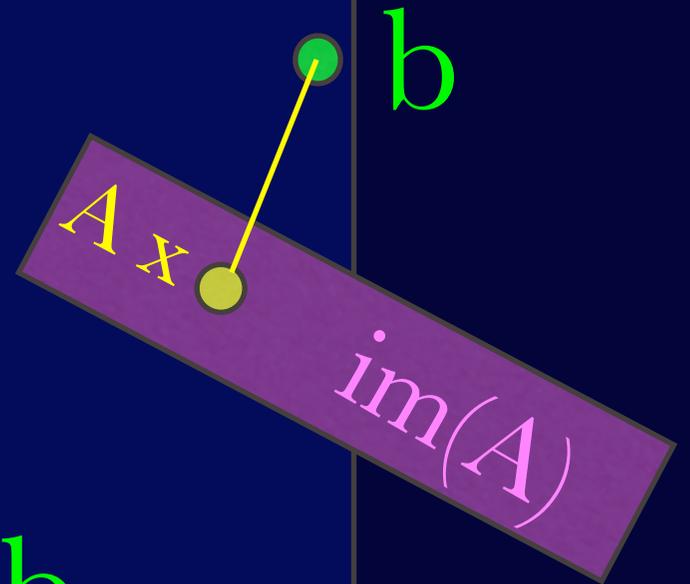

$nm+3$  equations

$2n+2m$  unknowns

# Least square:

$$A \mathbf{x} = \mathbf{b}$$

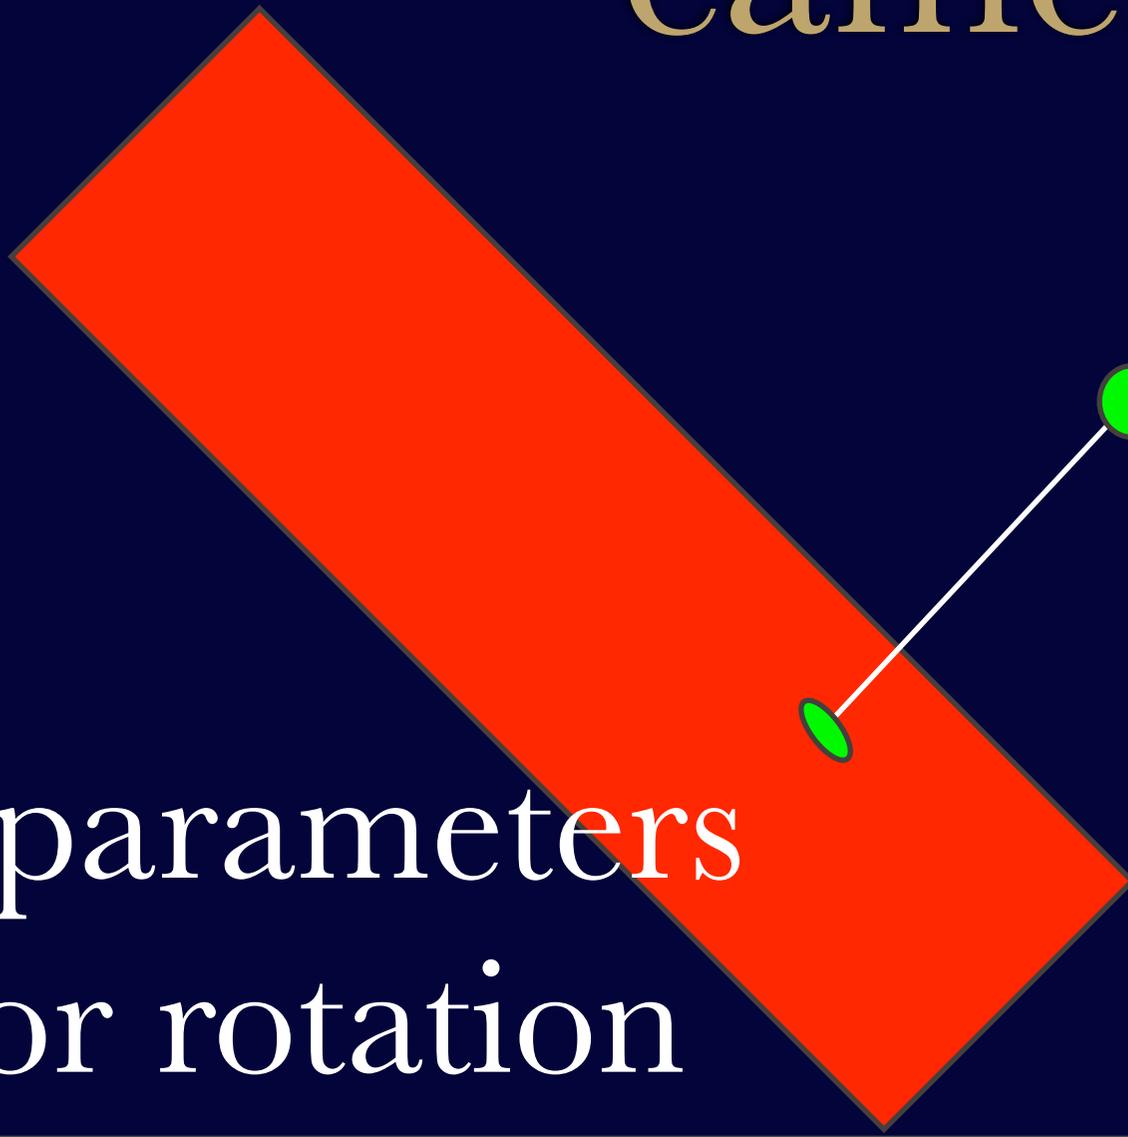

$$\mathbf{x} = (A^T A)^{-1} A^T \mathbf{b}$$

This finishes the  
discussion on  
omnidirectional  
cameras

Affine  
orthographic  
cameras

# Orthographic camera

3 parameters  
for rotation

P  
preserves parallelism  
is an affine camera.  
NO definite location  
of the camera!

Have 3 cameras

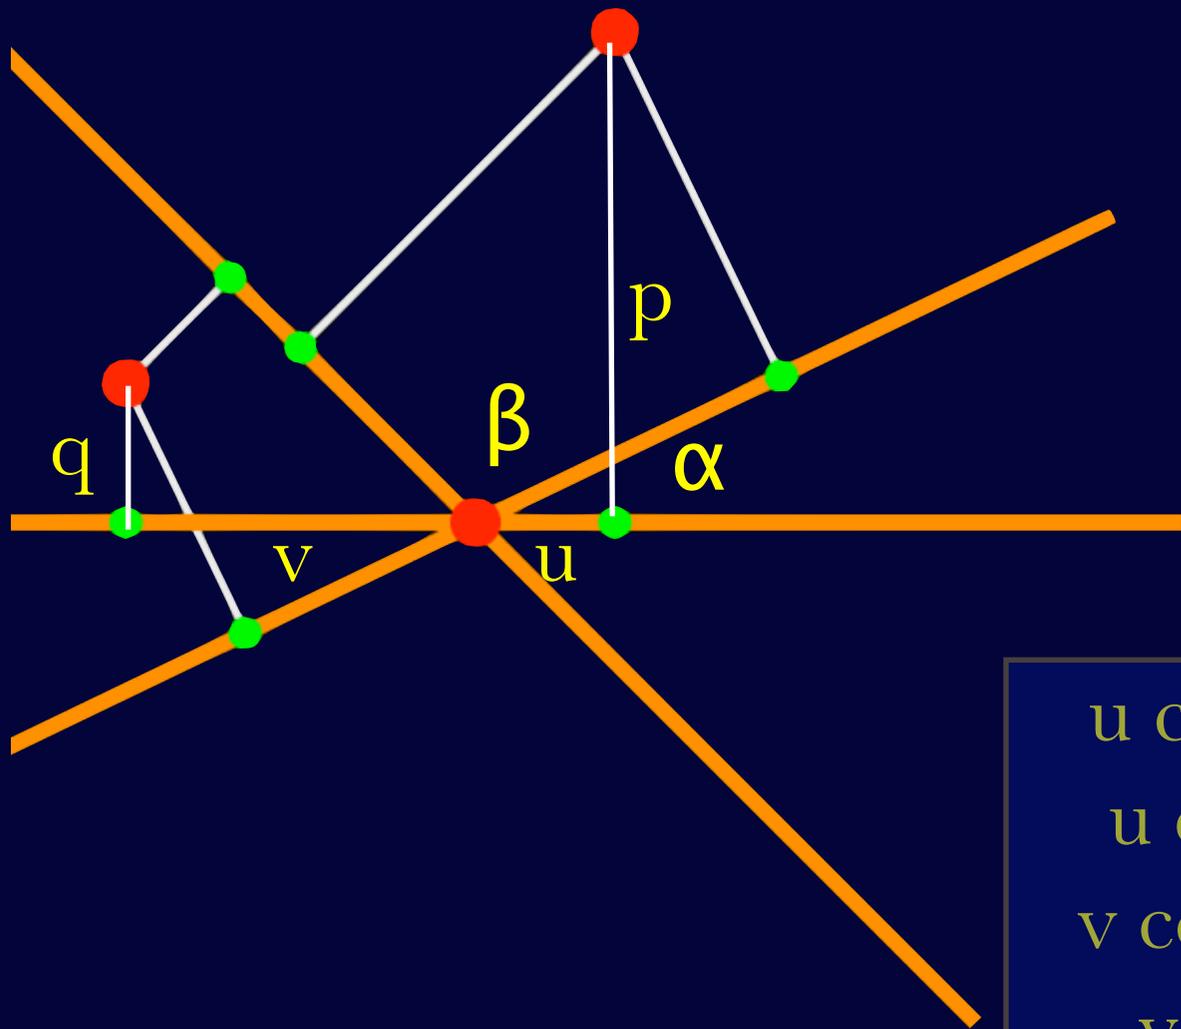

How many

points

are needed?

# Equations

solve for  $p, q, \alpha, \beta$

$$\begin{aligned}u \cos(\alpha) + p \sin(\alpha) &= a \\u \cos(\beta) + p \sin(\beta) &= c \\v \cos(\alpha) + q \sin(\alpha) &= b \\v \cos(\beta) + q \sin(\beta) &= d\end{aligned}$$

# Nonlinear map

$$u \cos(\boldsymbol{\alpha}) + p \sin(\boldsymbol{\alpha}) = a$$

$$u \cos(\boldsymbol{\beta}) + p \sin(\boldsymbol{\beta}) = c$$

$$v \cos(\boldsymbol{\alpha}) + q \sin(\boldsymbol{\alpha}) = b$$

$$v \cos(\boldsymbol{\beta}) + q \sin(\boldsymbol{\beta}) = d$$

$$\mathbf{F}(\mathbf{x}) = \mathbf{y}$$

$\det(\mathbf{DF}(\mathbf{x}))$  not zero assures  
locally unique solution

# Inversion

$$y = F^{-1}(x)$$

## APPENDIX 1

### THE STRUCTURE FROM MOTION THEOREM

**The structure from motion theorem:**

Given three distinct orthographic projections of four non-coplanar points in a rigid configuration, the structure and motion compatible with the three views are uniquely determined up to a reflection about the image plane.

1979

Affine camera:

$d=2, m=3, n=5$

# Theorem (Knill-Ramirez)

(Addition to Ullmans theorem)

Both in space and in the  
plane, three cameras and  
three points allow a

**locally**

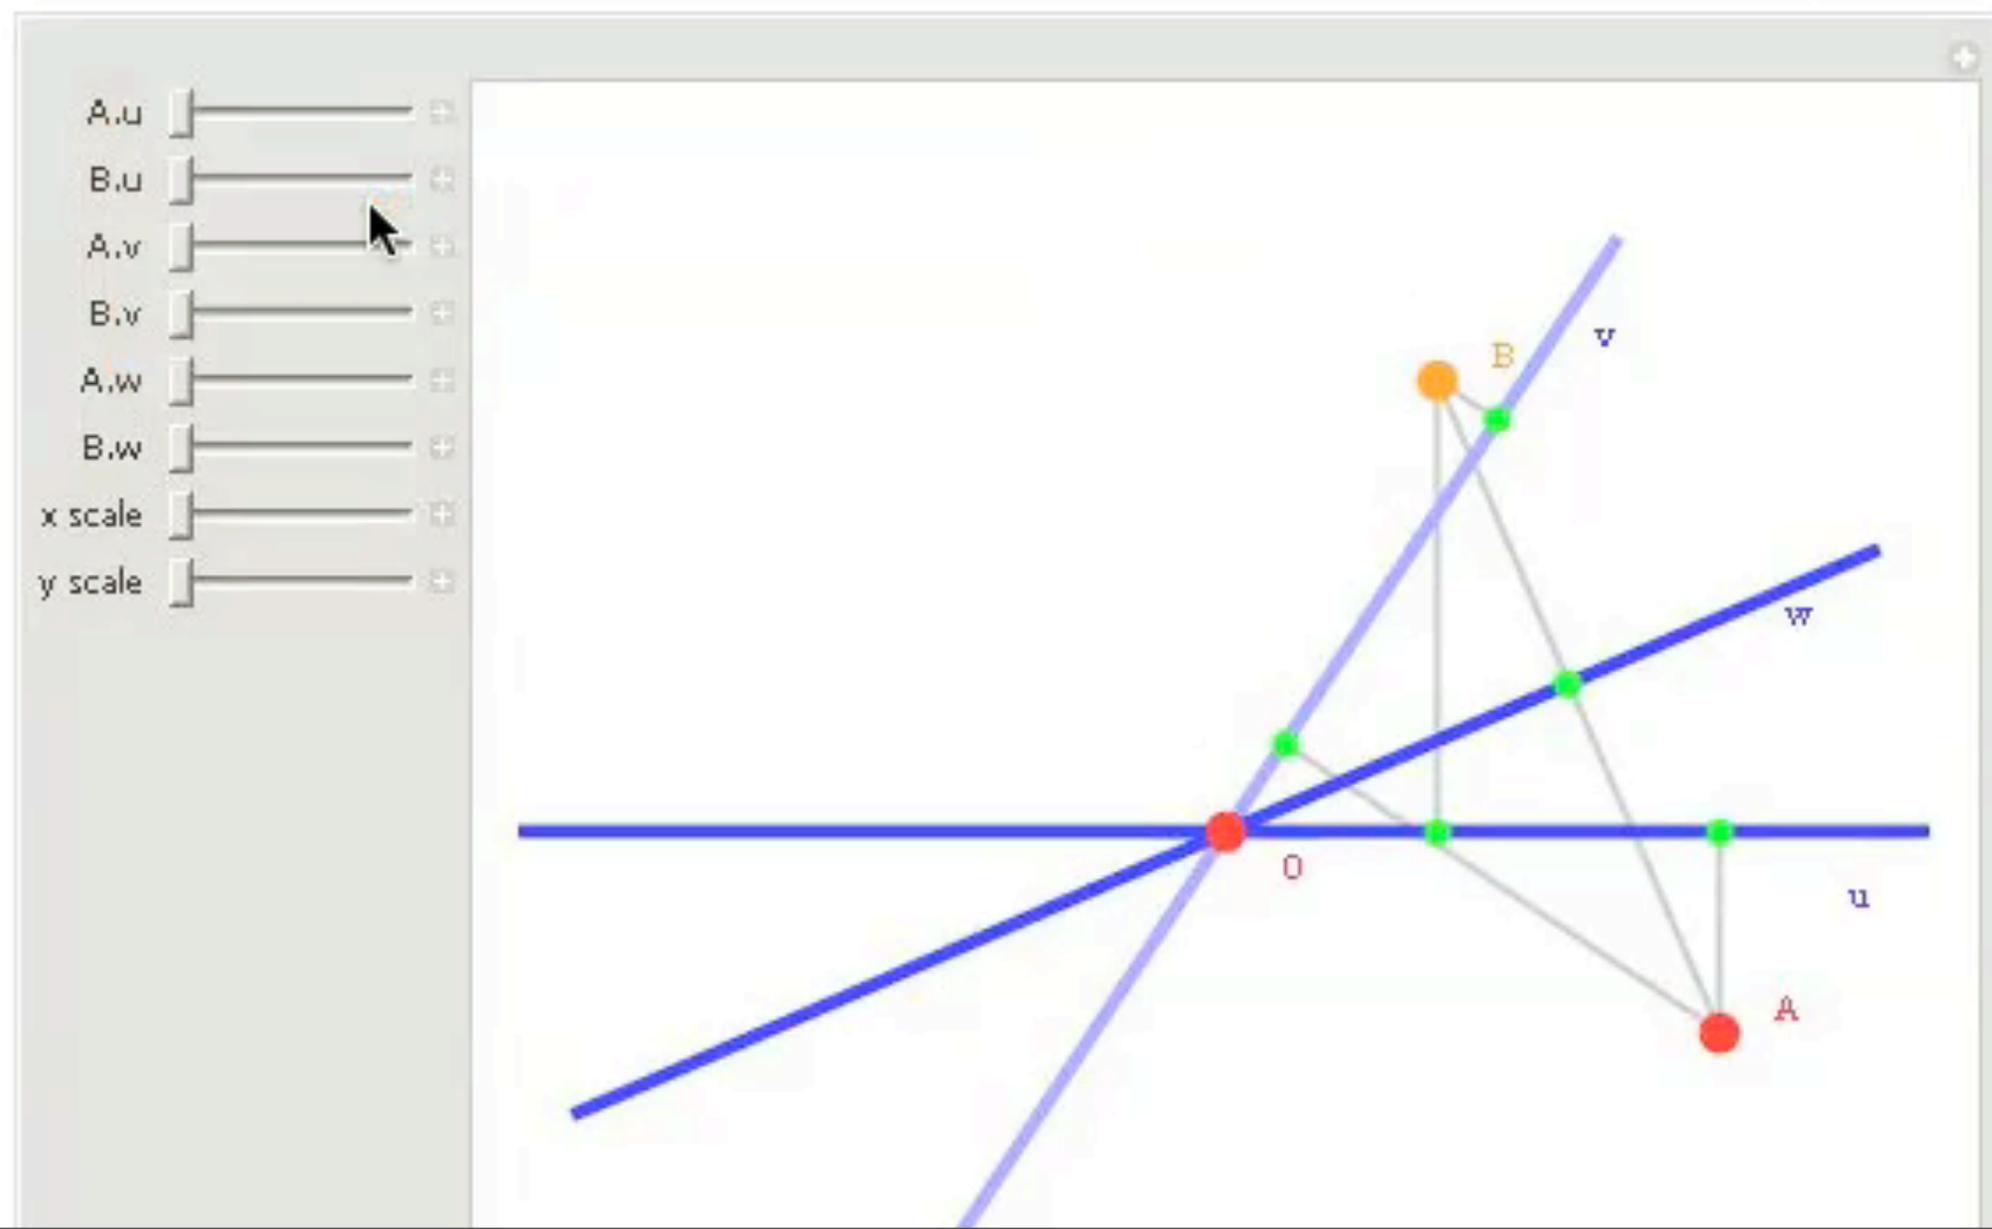

unique reconstruction.

Ullman theorem  
assumes 4 points and gets  
uniqueness up to a  
reflection, with 3 points  
we have uniqueness  
modulo finitely many  
reflections.

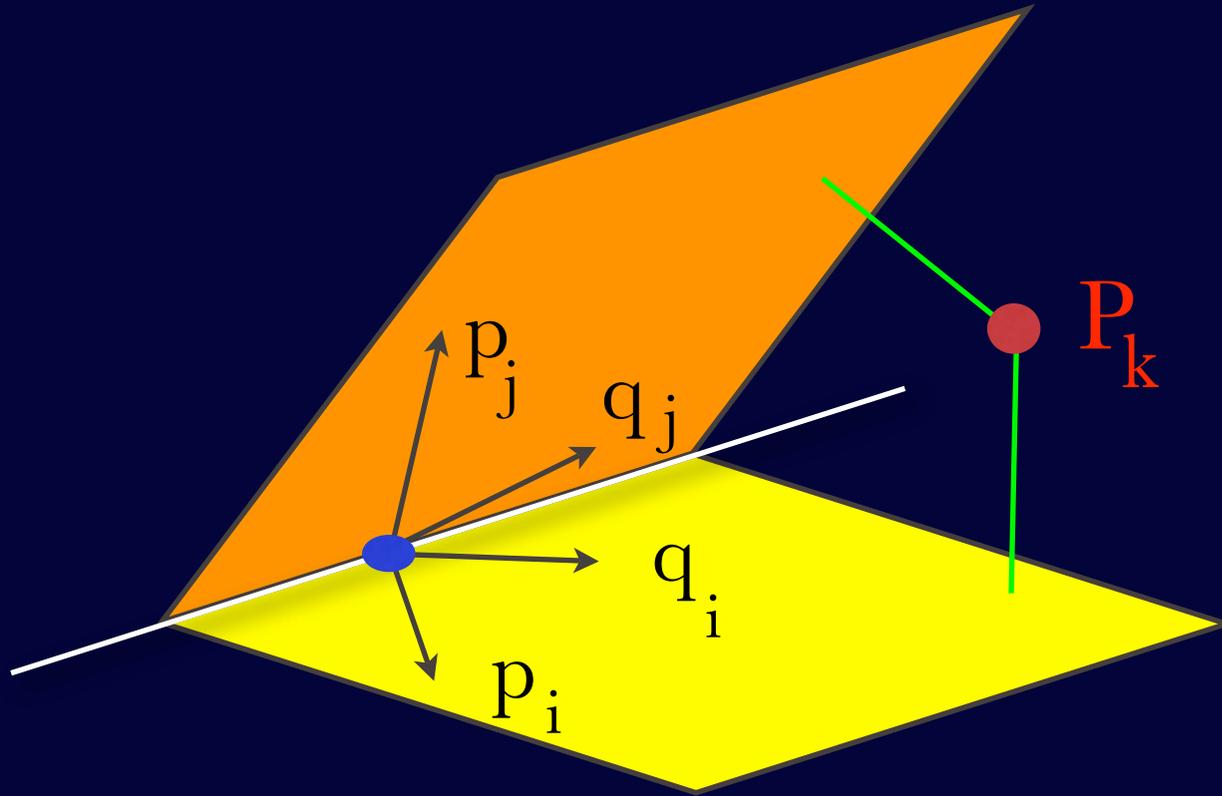

# Ullman's Theorem in Two Dimensions

[DOWNLOAD LIVE VERSION >>](#)

[watch web preview >>](#)

$$\alpha_{ij} p_i + \beta_{ij} q_i = \alpha_{ij} p_j + \beta_{ij} q_j$$

in three dimensions, a new idea is needed.  
And this has been done by Ullman.

$$\alpha_{ij}u_{i1} + \beta_{ij}v_{i1} = \gamma_{ij}u_{j1} + \delta_{ij}v_{j1}$$

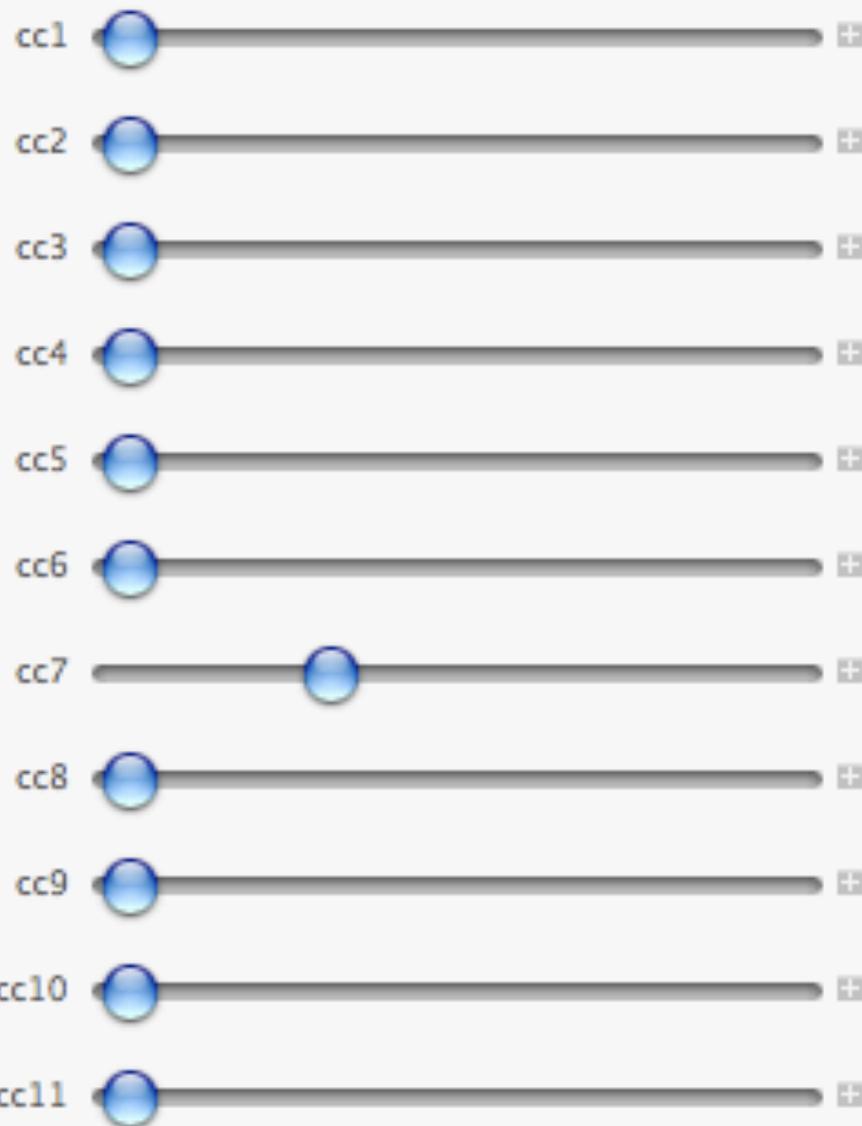

$$\alpha_{ij}u_{i2} + \beta_{ij}v_{i2} = \gamma_{ij}u_{j2} + \delta_{ij}v_{j2}$$

$$\alpha_{ij}^2 + \beta_{ij}^2 = 1 \quad , \quad \gamma_{ij}^2 + \delta_{ij}^2 = 1$$

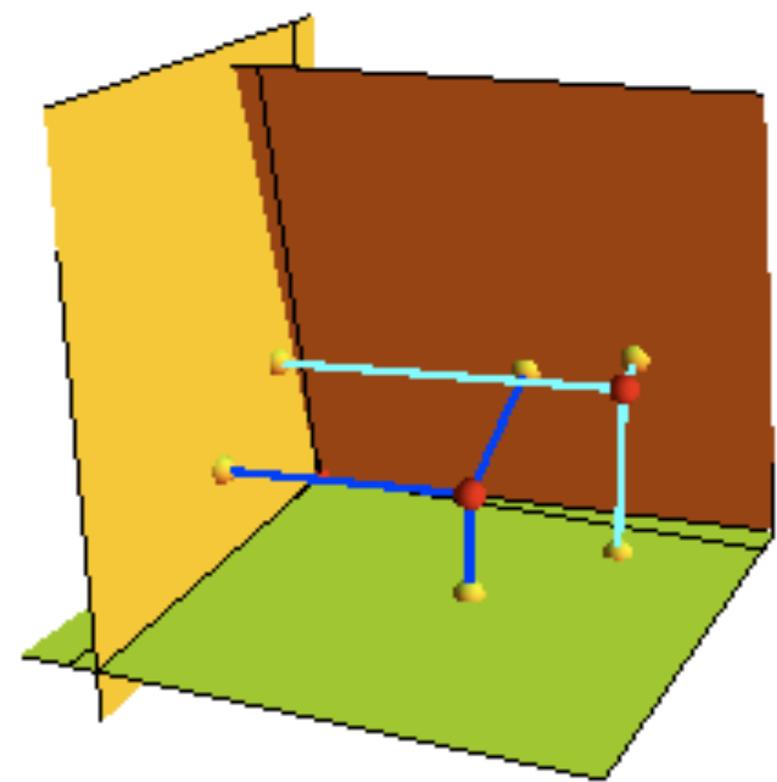

This is a system of nonlinear equations for each  $i,j$ . Have 4 equations and 4 unknowns.

Computer algebra systems have problems solving it, humans not....

```

# Perspective Cameras

This is the main case considered in the  
computer vision literature.

Albrecht Duerer, 1471-1528

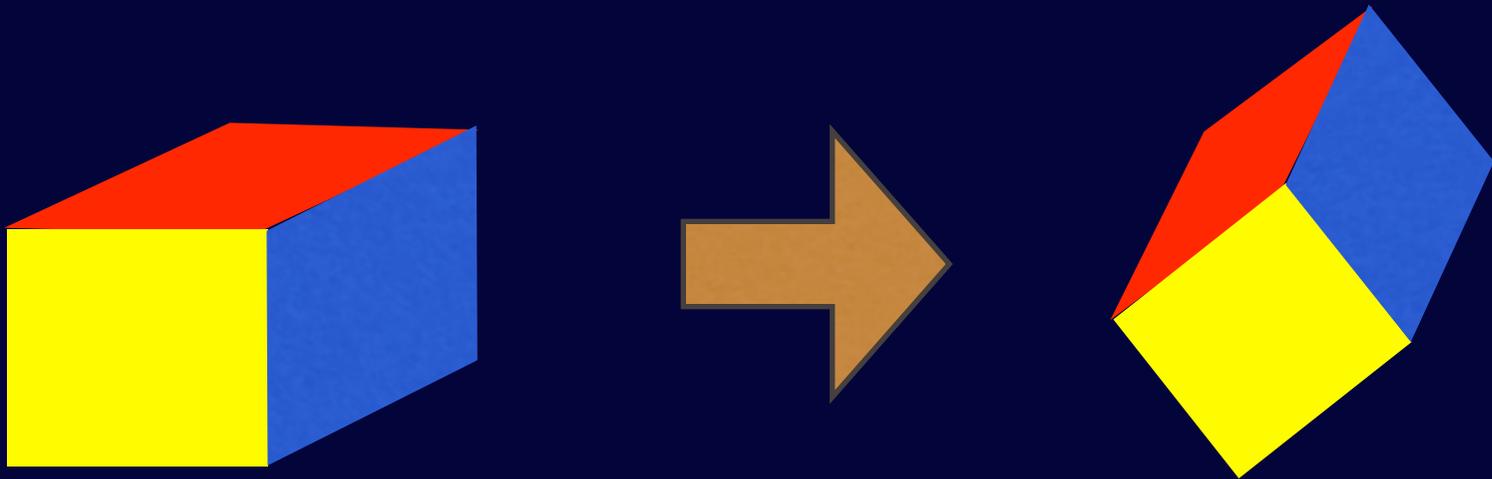

Edme-Sebastien Jaurat, *Traite de perspective a l'usage des artistes*,  
Paris: Jombert, 1750

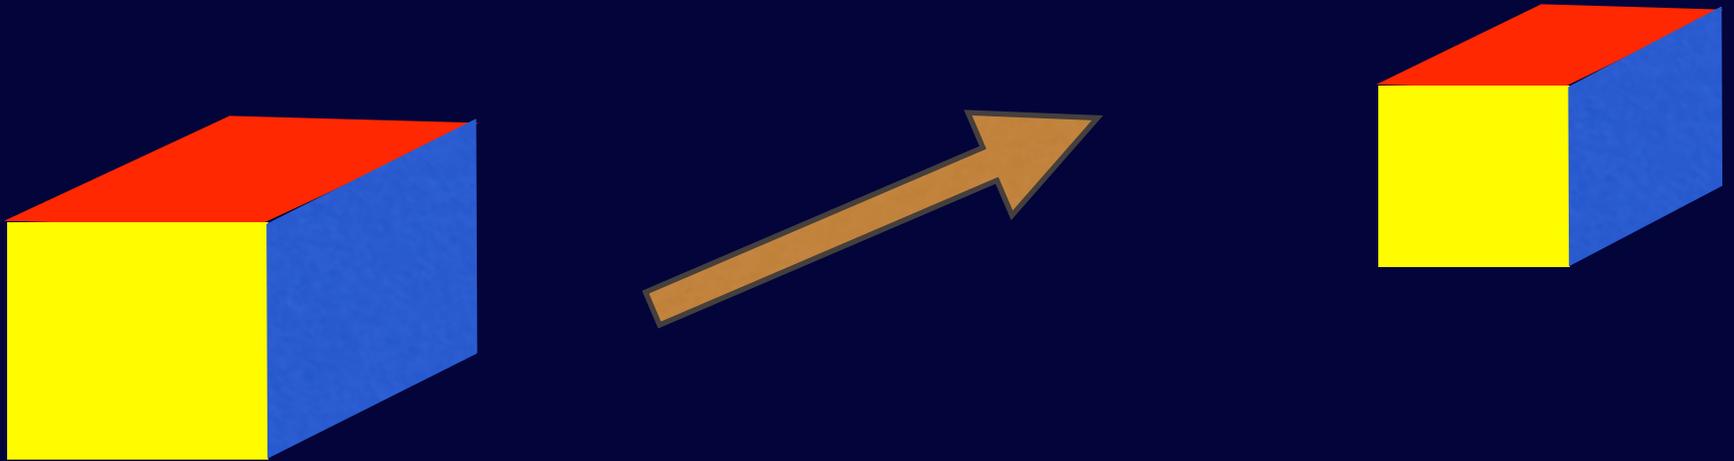

# Rotation

A rotation in space is described by 3 angles. Rotations form a group, one can compose rotations to get a new rotation.

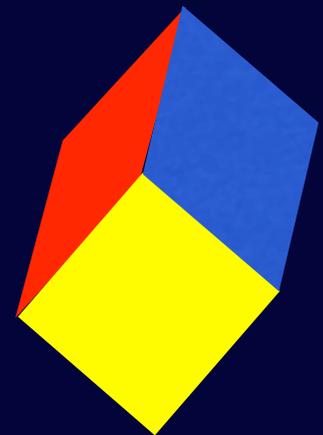

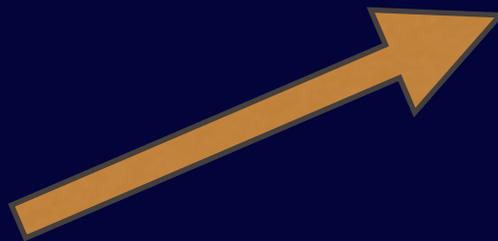

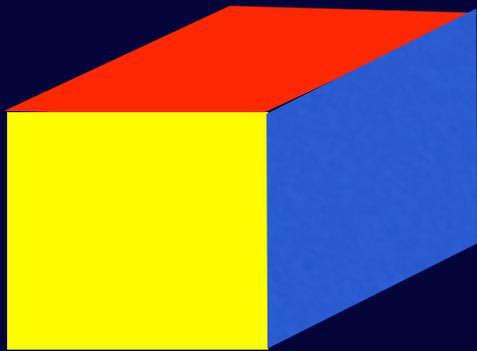

# Translation

Also a translation is described by 3 parameters. Translations form a group too.

# Euclidean transforms

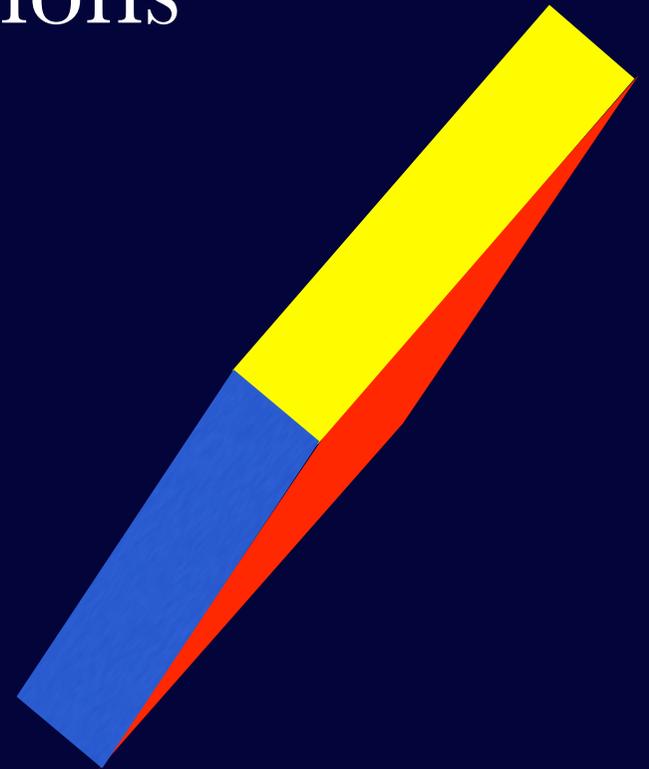

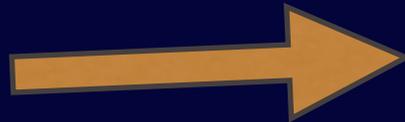

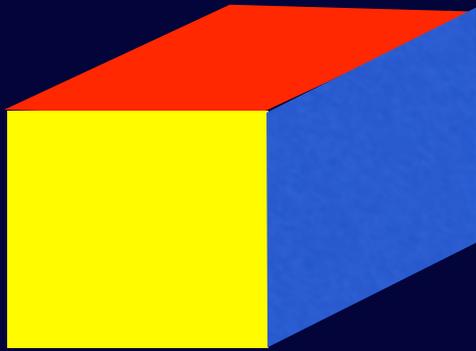

Translations and rotations generate  
the group of Euclidean  
transformations

6 parameters

# Affine transforms

If we also can shear and scale, we get affine transformations

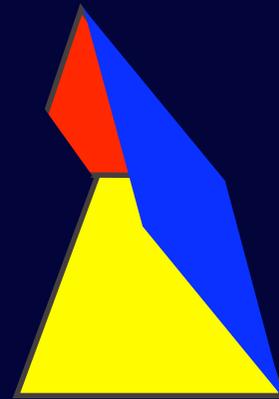

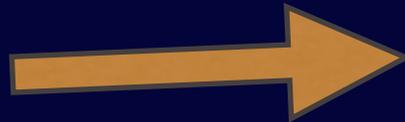

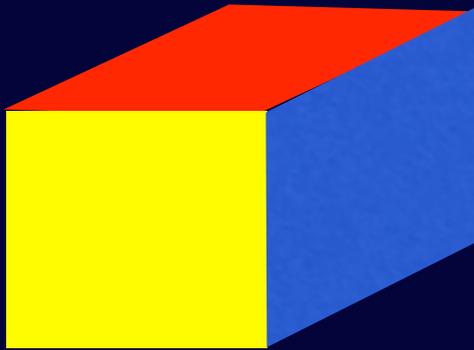

parallel lines still  
stay parallel

12 parameters

# Projective transforms

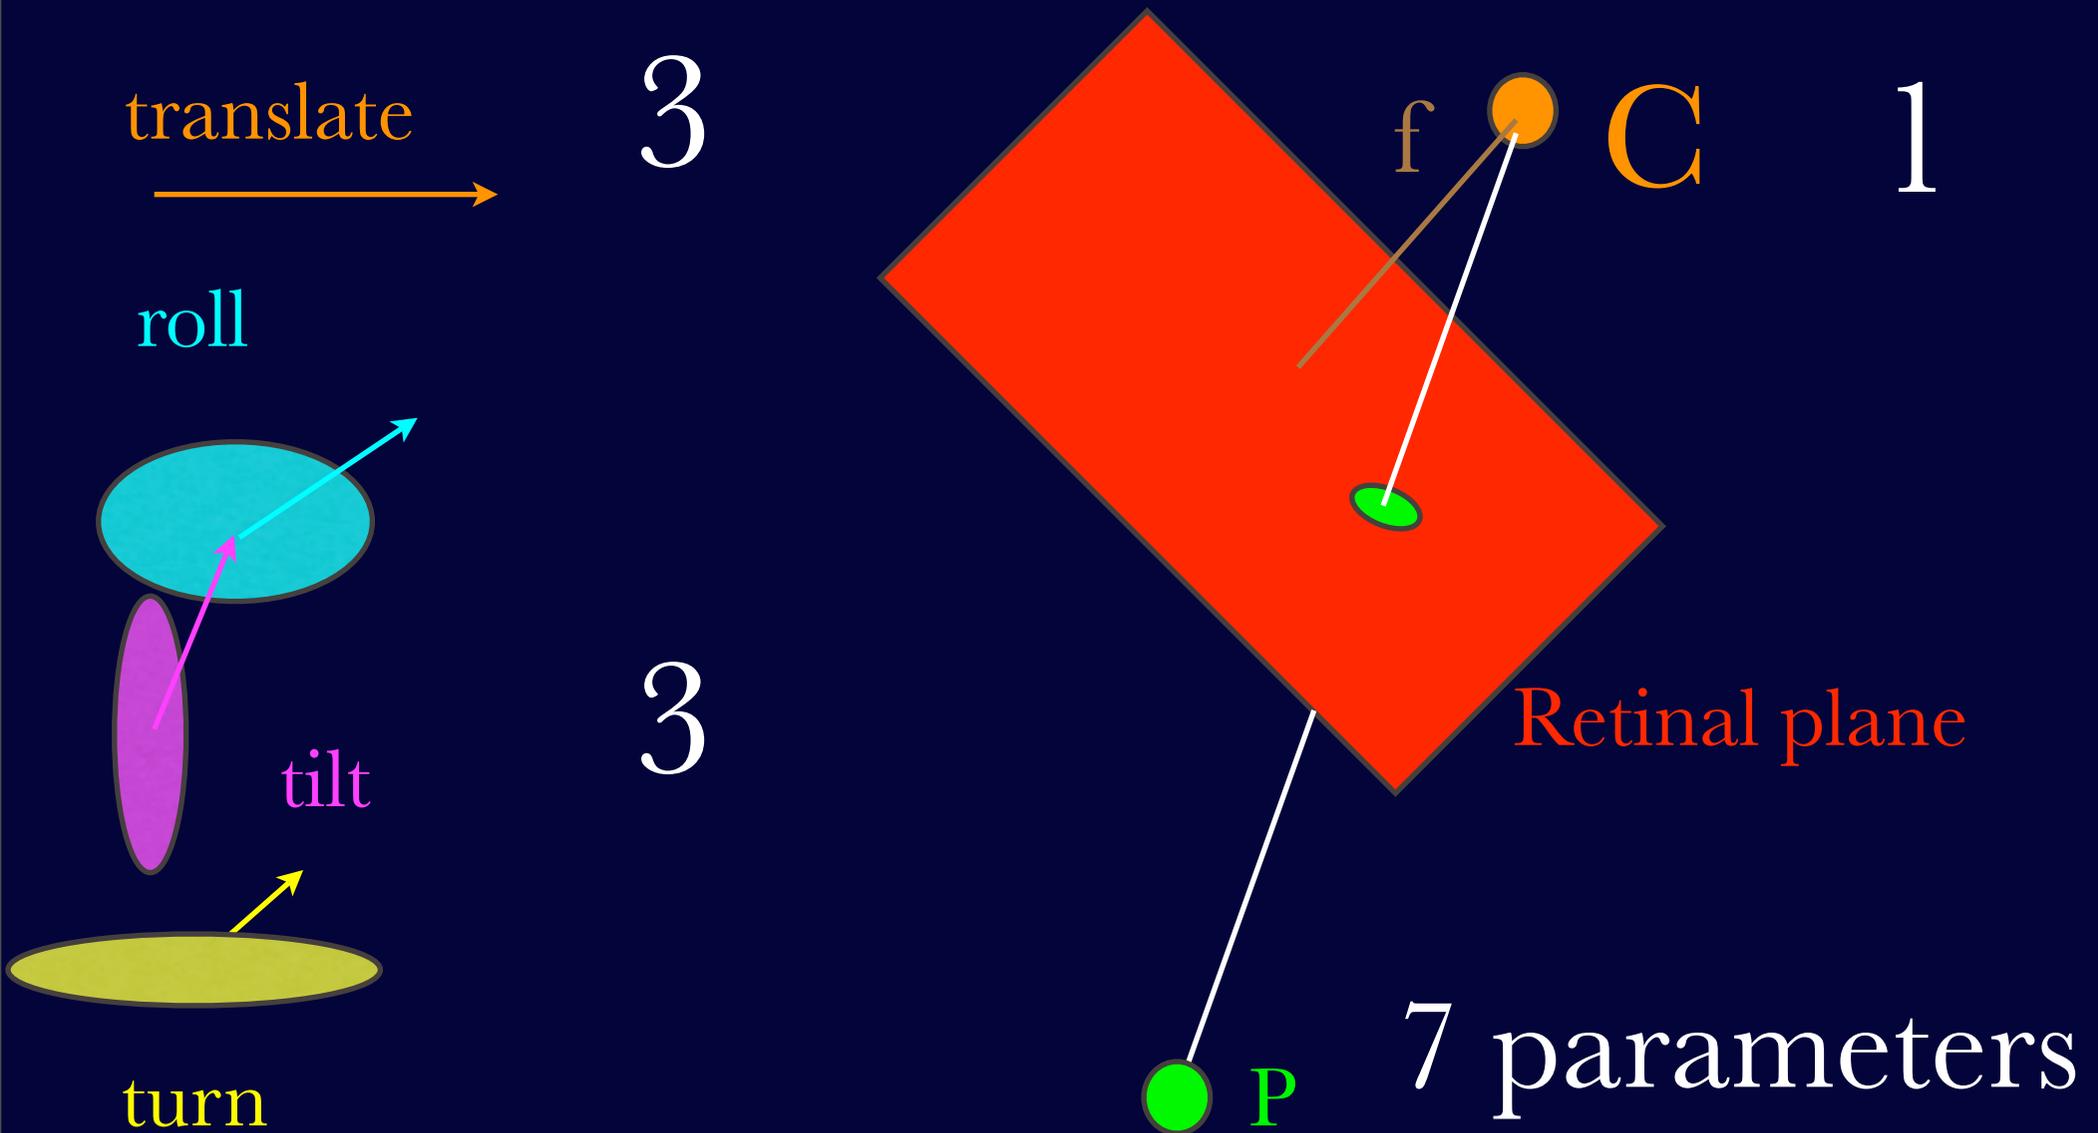

We even allow perspective transformations

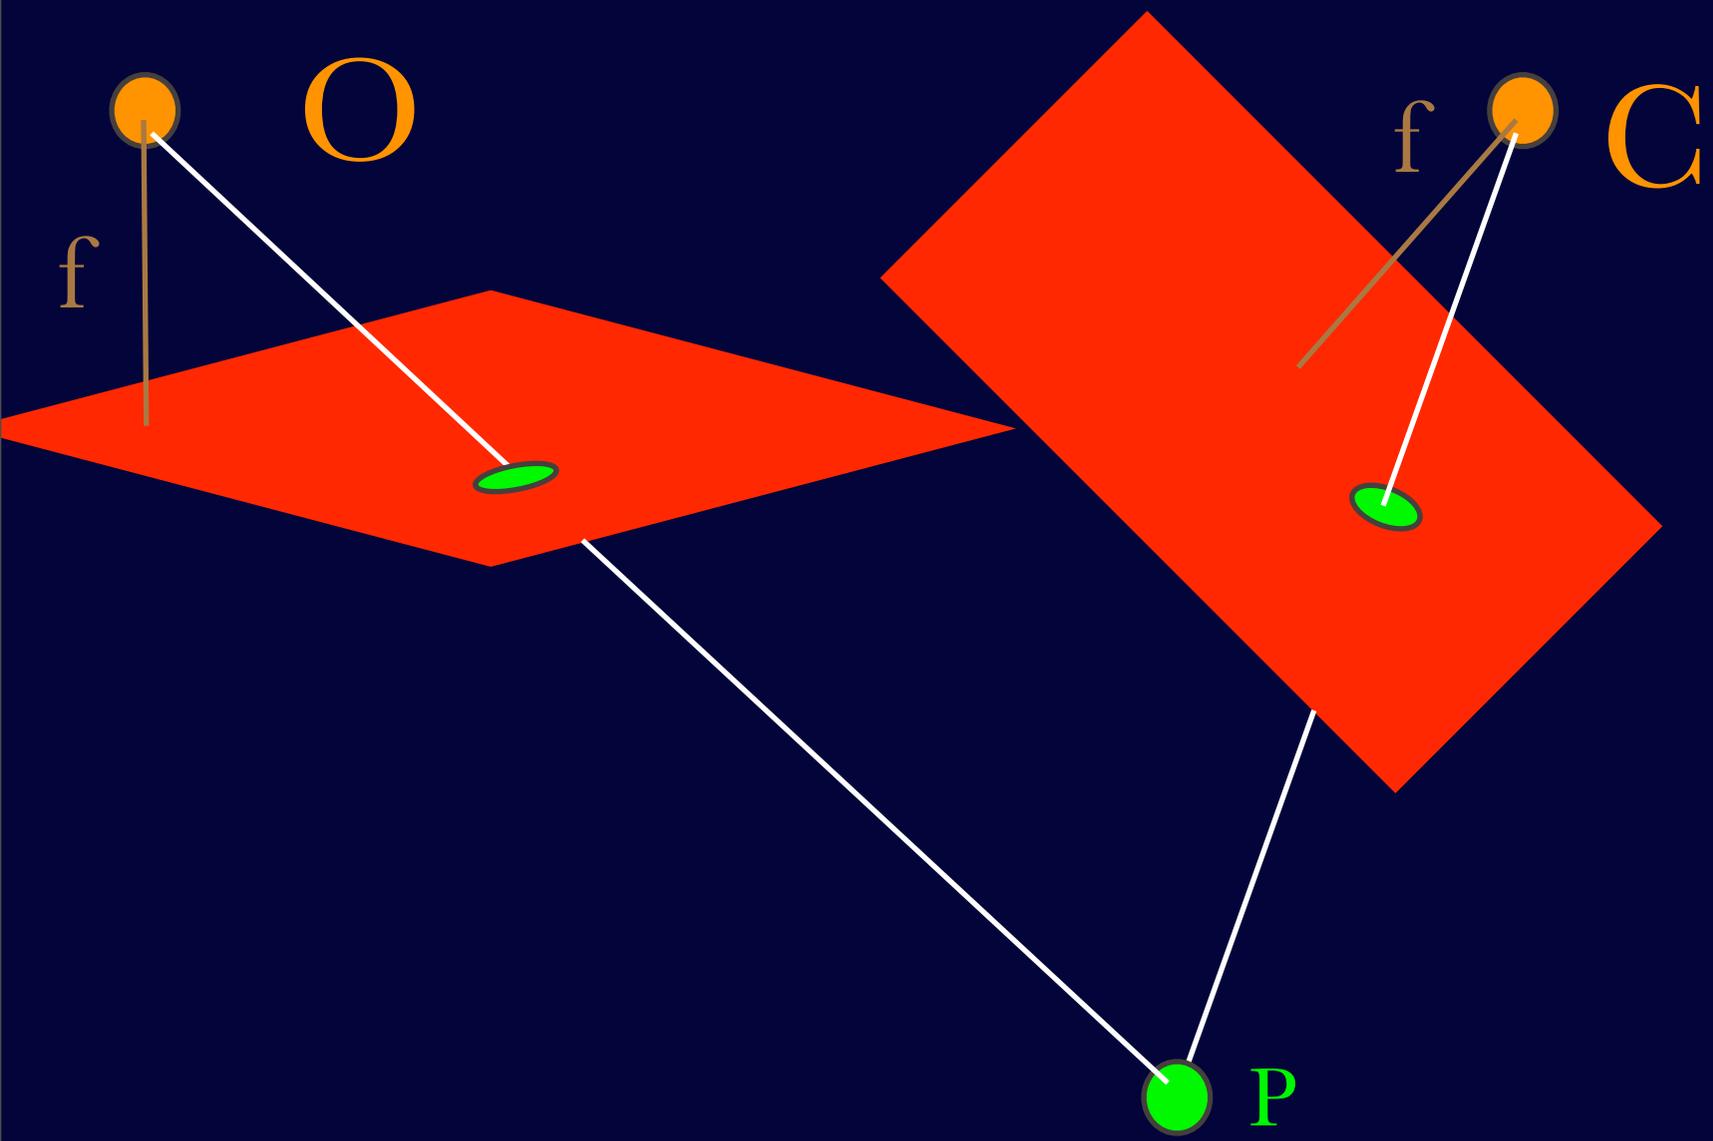

parallel lines stay  
no more parallel  
in general

15 parameters

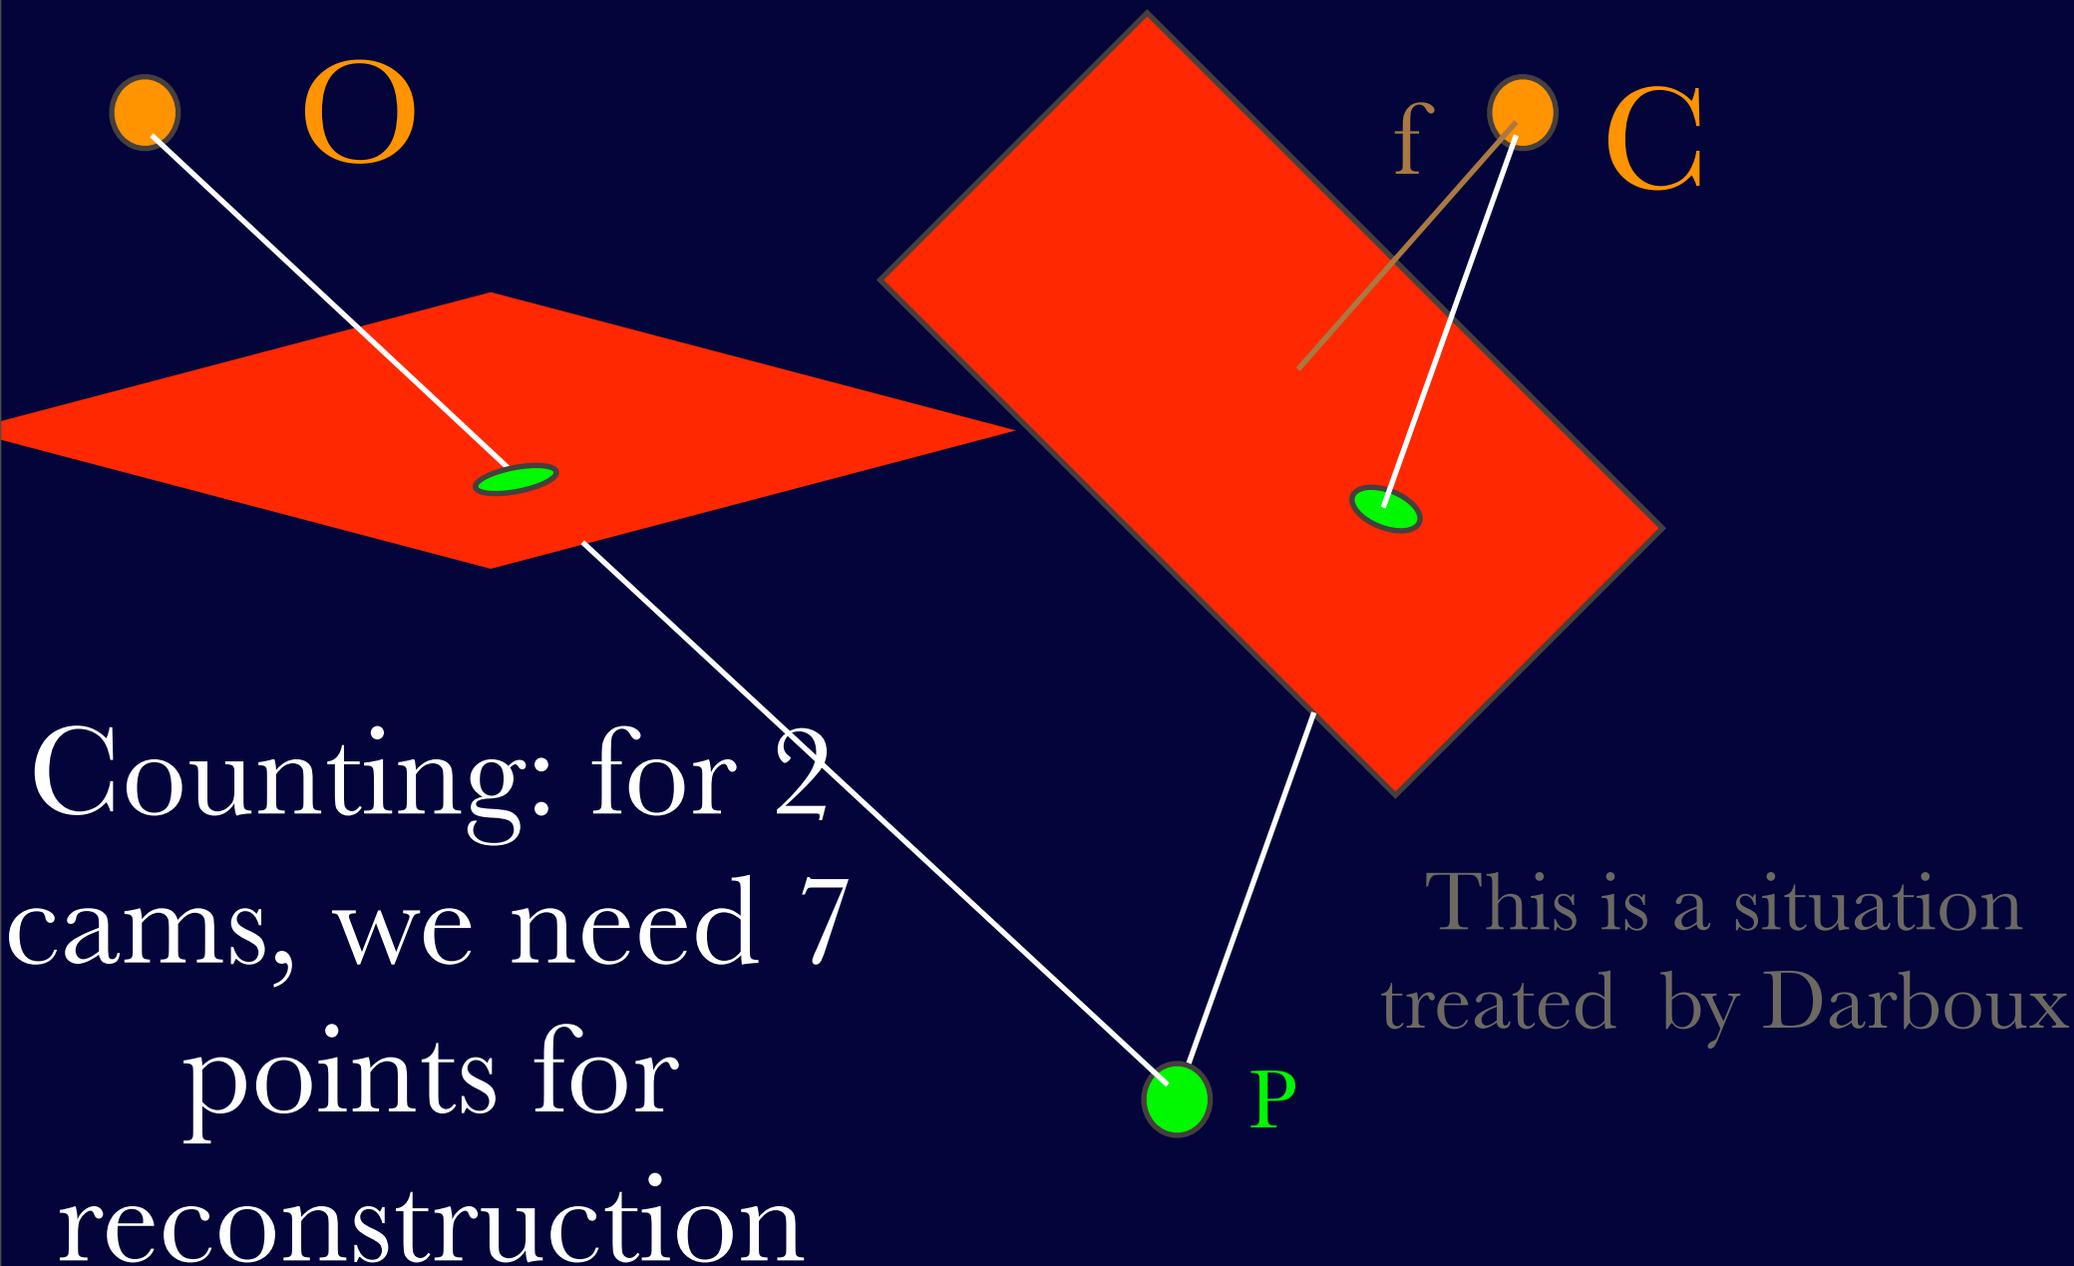

# Traditional camera

# 2 cams how many pts?

Every point introduces 3 unknowns  
and 4 picture coordinates

# The general problem

Space is a manifold  $N$ . A camera is a map  $Q: N \rightarrow N$  where  $Q(N)$  is a lower dimensional surface diffeomorphic to  $S$  and  $Q^2 = Q$ .  
Given a manifold  $M$  of cameras.

$P_1, P_2, \dots, P_n$  points in  $N$

$Q_1, Q_2, \dots, Q_m$  cameras in  $M$

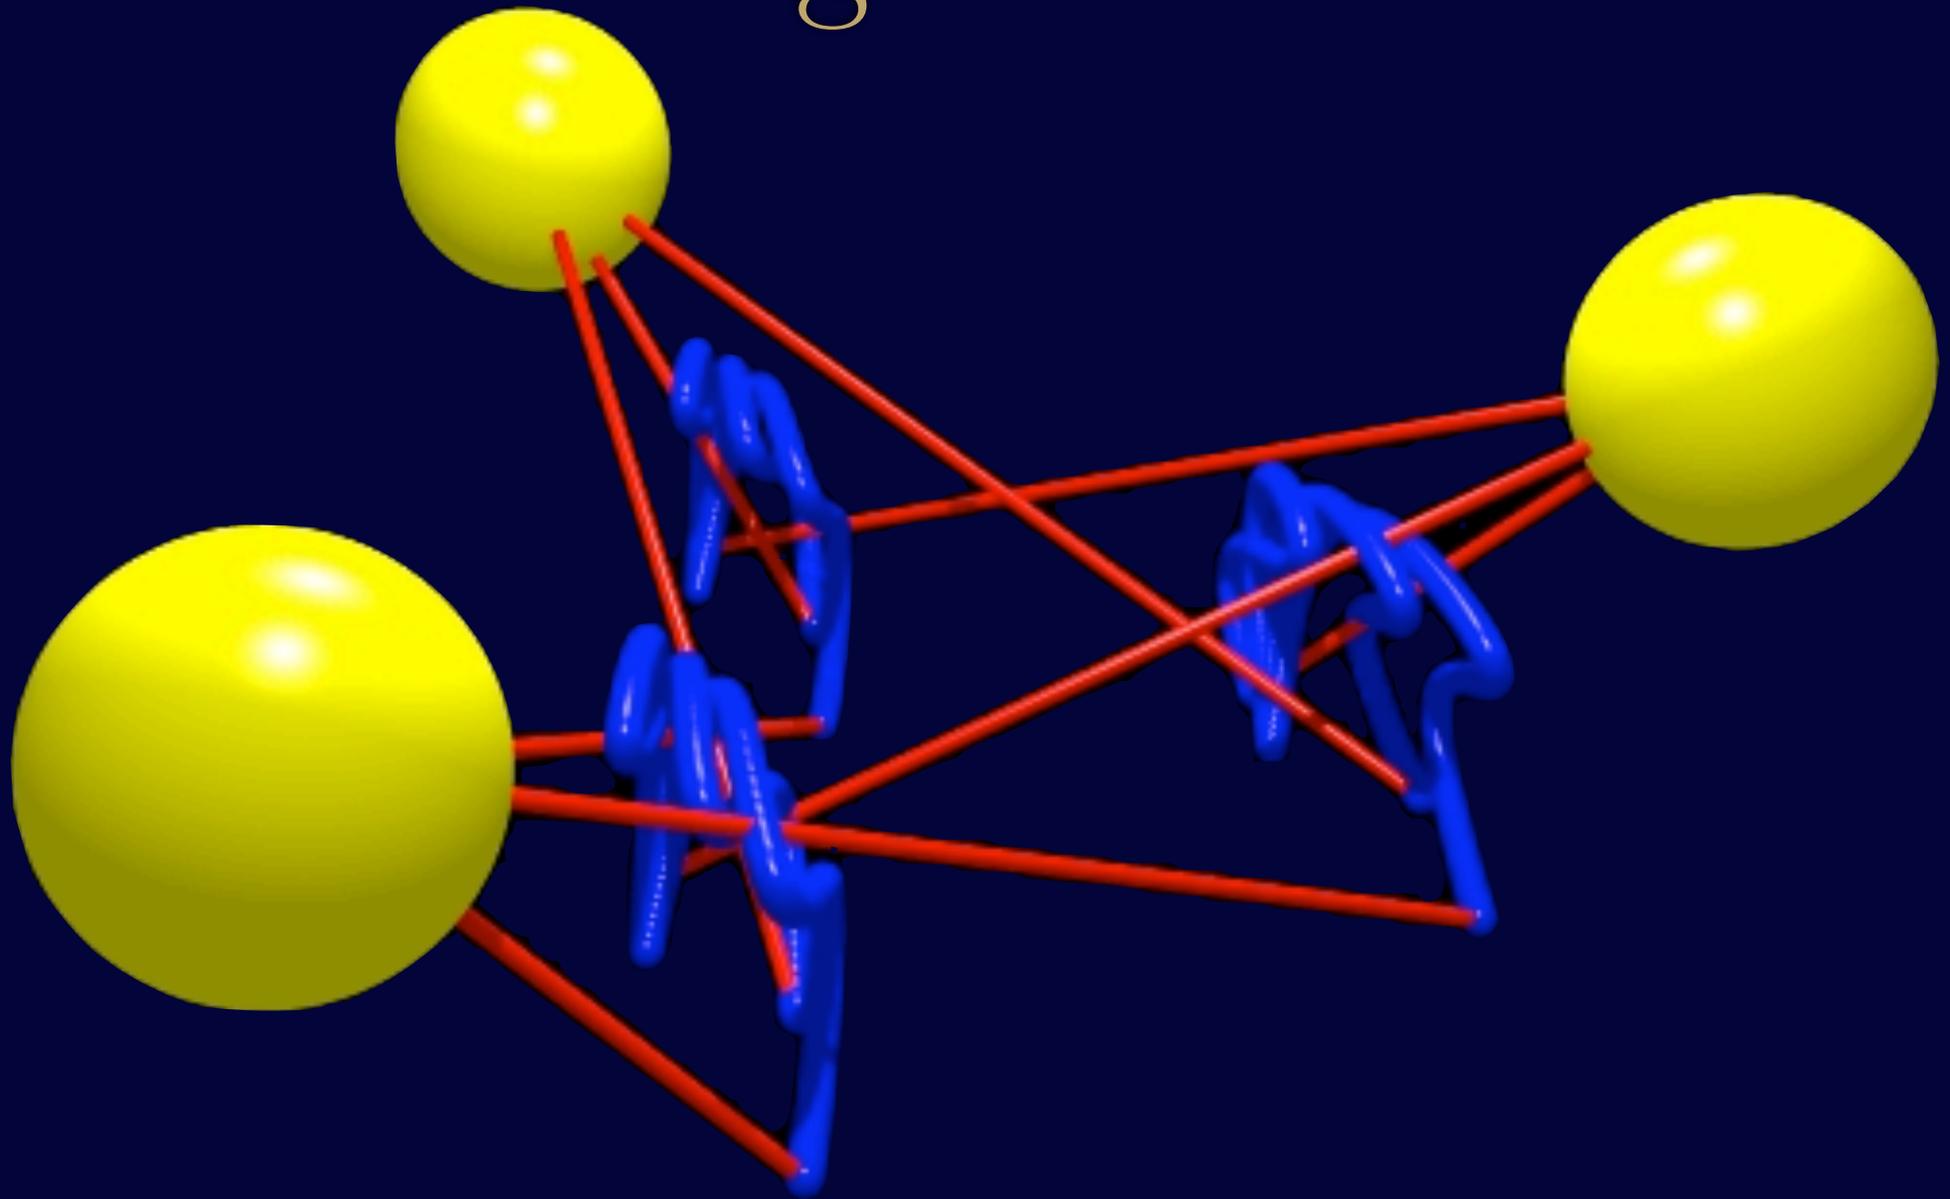

Reconstruct points and cameras from the data matrix  $Q_j(P_i)$ .

General critics  
on mathematics:

Why such

f&@#\$\*%  
generality?

cover move general situations

# The SFM inequality

d dimension of space

n number of points

f number of camera parameters

m number of cameras

h global camera parameters

s dimension of retinal surface

g global symmetries

$$d n + f m + h \leq s \quad n m + g$$

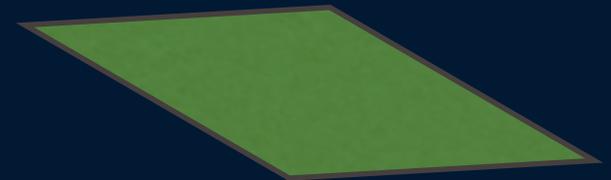

Example: orthographic camera

$$d=3, m=3, n=3, s=2$$

$g=6$ : translations  
and rotations

$$f=5, h=0$$

3 angles, 2  
translations in plane

QUESTION.

296. On donne dans le même plan deux systèmes de sept points chacun et qui se correspondent. Faire passer par chacun de ces systèmes un faisceau de sept rayons, de telle sorte que les deux faisceaux soient homographiques. Démontrer qu'il n'y a que trois solutions. (CHASLES.)

---

EXERCICES SUR DE GRANDS NOMBRES.

$$2^a = 63382\ 533001\ 14114\ 70074\ 83516\ 02688 = a,$$

$$\log 2 = 0,30102\ 99956\ 63981\ 19521\ 37388\ 94724\ 49,$$

$a \log 2$  donne pour caractéristique

$$19080\ 04273\ 45073\ 52812\ 21794\ 13680 = b,$$

ainsi,  $b + 1$  est le nombre de chiffres de  $2^a$ .

Ce calcul a été fait par Clausberg et se trouve dans son ouvrage *Démonstrativer Rechenkunst*, Arithmétique démonstrative, III<sup>e</sup> partie, § 1474; Leipzig, 1782; in-8<sup>o</sup>. On y donne les logarithmes de Briggs de 1 à 100 avec 32 décimales. Les Tables de Callet renferment de tels logarithmes de 1 à 1097 avec 61 décimales; mais il faut prendre les dix décimales à gauche dans la Table des 20 décimales.

# Chasles, 1855

## THÉORIE DE LA DIVISION ARITHMÉTIQUE DES NOMBRES ENTIERS;

PAR M. L.-E. FAUCHEUX.

Traité avec la simplicité convenable, la division ne présentera pas aux élèves plus de difficultés que les autres règles arithmétiques.

(Nouveau Programme de l'École Polytechnique.)

*Lemme.* Soit à multiplier deux nombres, par exemple 7436 par 48. On pourra toujours obtenir le produit de la manière suivante. On multipliera d'abord 48 par 6, ce qui donnera 288; on écrira 8 et on retiendra 28. On multipliera ensuite 48 par 3, ce qui donnera 144, à quoi on ajoutera 28 du produit partiel précédent, ce qui donnera 172; on écrira 2 et on retiendra 17. On multipliera 48 par 4, et au produit 192 on ajoutera 17, ce qui donnera 209; on écrira 9 et on retiendra 20. Enfin on multipliera 48 par 7, et au produit 336 on ajoutera 20; on aura 356, qu'on écrira entièrement, et le produit sera 356928.

On pourra toujours considérer le produit d'une multiplication effectuée comme ayant été obtenu par ce procédé-là.

Dans cette multiplication, il n'y a qu'un produit partiel entièrement écrit, c'est le dernier, c'est-à-dire le produit du multiplicateur par le chiffre des plus hautes unités du multiplicande. Des autres produits partiels on n'a écrit que le chiffre des unités; et ce chiffre exprime des unités de même ordre que celles du chiffre du multiplicande qui a donné le produit partiel.

Les retenues de chaque produit partiel n'égalent jamais le multiplicateur 48; en effet, le premier produit

In aerial photography, the problem arises of matching partial shots of an area which is too large to fit in a single photo. Assuming the area to be flat, it is possible to use perspectives to make overlapping parts coincide perfectly: the correspondence between matching points in two photographs is a homography, being the composition of the perspectives of the two photos (figure 4.7.3.1), and thus can be composed with another homography to give the identity. By proposition 4.5.10, it is enough to match four points in the two images to obtain a perfect correspondence. See [BUR, 36–51].
