## Unit 7: Parametrized curves

### LECTURE

**Definition:** A **parametrization** of a planar curve is a map  $\vec{r}(t) = [x(t), y(t)]$  from a **parameter interval**  $R = [a, b]$  to the plane. The functions  $x(t)$  and  $y(t)$  are called **coordinate functions**. The image of the parametrization is called a **parametrized curve** in the plane. Similarly, the parametrization of a **space curve** is  $\vec{r}(t) = [x(t), y(t), z(t)]$ . The image of  $\vec{r}$  is called a **parametrized curve** in space.

**7.1.** We think of the **parameter**  $t$  as **time** and the parametrization as a **drawing process**. The curve is the result what you **see**. For a fixed time  $t$ , we have a vector  $[x(t), y(t), z(t)]$  in space. As  $t$  varies, the end point of this vector moves along the curve. The parametrization contains **more information** about the curve than the curve itself. It tells for example how fast the curve was traced.

**7.2.** Curves can describe the paths of particles, celestial bodies, or other quantities which change in time. Examples are the motion of a star moving in a galaxy, or economical data changing in time. Here are some more places, where curves appear:

<b>Strings or knots</b>	are closed curves in space.
<b>Molecules</b>	like RNA or proteins.
<b>Graphics:</b>	grid curves produce a mesh of curves.
<b>Typography:</b>	fonts represented by Bézier curves.
<b>Relativity:</b>	curve in space-time describes the motion of an object
<b>Topology:</b>	space filling curves, boundaries of surfaces or knots.

**Definition:** Any vector parallel to the velocity  $\vec{r}'(t)$  is called **tangent** to the curve at  $\vec{r}(t)$ .

You know from single variable the **addition rule**  $(f + g)' = f' + g'$ , the **scalar multiplication rule**  $(cf)' = cf'$  and the **Leibniz rule**  $(fg)' = f'g + fg'$  as well as the **chain rule**  $(f(g))' = f'(g)g'$ . They generalize to vector-valued functions.

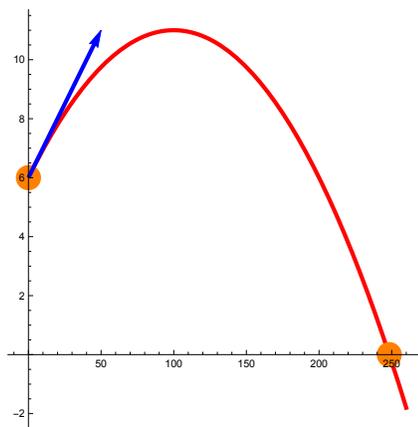

$$(\vec{v} + \vec{w})' = \vec{v}' + \vec{w}', (c\vec{v})' = c\vec{v}', (\vec{v} \cdot \vec{w})' = \vec{v}' \cdot \vec{w} + \vec{v} \cdot \vec{w}' \quad (\vec{v} \times \vec{w})' = \vec{v}' \times \vec{w} + \vec{v} \times \vec{w}'$$

$$(\vec{v}(f(t)))' = \vec{v}'(f(t))f'(t).$$

The process of differentiation of a curve can be reversed using the **fundamental theorem of calculus**. If  $\vec{r}'(t)$  and  $\vec{r}(0)$  is known, we can figure out  $\vec{r}(t)$  by **integration**  $\vec{r}(t) = \vec{r}(0) + \int_0^t \vec{r}'(s) ds$ .

Assume we know the acceleration  $\vec{a}(t) = \vec{r}''(t)$  at all times as well as initial velocity and position  $\vec{r}'(0)$  and  $\vec{r}(0)$ . Then  $\vec{r}(t) = \vec{r}(0) + t\vec{r}'(0) + \vec{R}(t)$ , where  $\vec{R}(t) = \int_0^t \vec{v}(s) ds$  and  $\vec{v}(t) = \int_0^t \vec{a}(s) ds$ .

The **free fall** is the case when acceleration is constant. The direction of the constant force defines what is "down". If  $\vec{r}''(t) = [0, 0, -10]$ ,  $\vec{r}'(0) = [0, 1000, 2]$ ,  $\vec{r}(0) = [0, 0, h]$ , then  $\vec{r}(t) = [0, 1000t, h + 2t - 10t^2/2]$ .

If  $\vec{r}''(t) = \vec{F}$  is constant, then  $\vec{r}(t) = \vec{r}(0) + t\vec{r}'(0) - \vec{F}t^2/2$ .

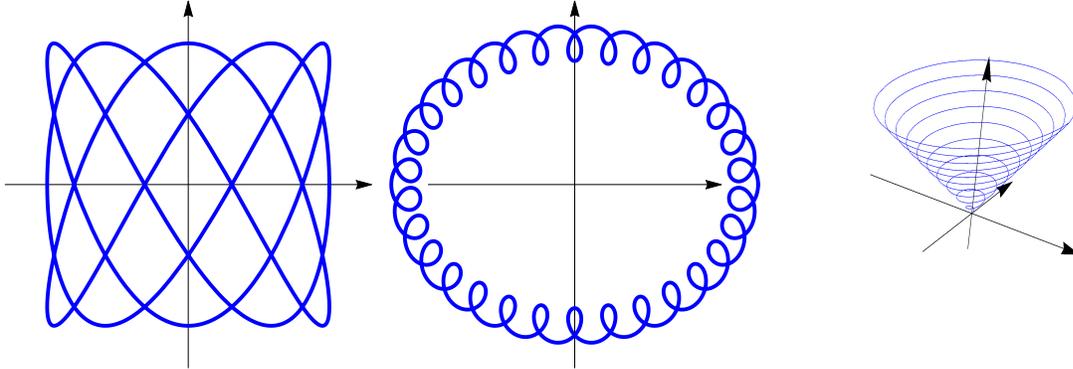

### EXAMPLES

#### 7.3. Examples:

1) The parametrization  $\vec{r}(t) = [1 + 2 \cos(t), 3 + 5 \sin(t)]$  is the ellipse  $(x - 1)^2/4 + (y - 3)^2/25 = 1$ . The parametrization  $\vec{r}(t) = [\cos(3t), \sin(5t)]$  is an example of a **Lissajous**

**curve.**

- 2) If  $x(t) = t$ ,  $y(t) = f(t)$ , the curve  $\vec{r}(t) = [t, f(t)]$  traces the **graph** of the function  $f(x)$ . For example, for  $f(x) = x^2 + 1$ , the graph is a parabola. 3) With  $x(t) = t \cos(t)$ ,  $y(t) = t \sin(t)$ ,  $z(t) = t$  we get the parametrization of a **space curve**  $\vec{r}(t) = [t \cos(t), t \sin(t), t]$  which traces a spiral on a cone  $x^2 + y^2 = z^2$ . 4) For  $x(t) = 2t \cos(2t)$ ,  $y(t) = 2t \sin(2t)$ ,  $z(t) = 2t$  traces the same curve but twice as fast. 5) If  $P = (a, b, c)$  and  $Q = (u, v, w)$  are points in space, then  $\vec{r}(t) = [a + t(u - a), b + t(v - b), c + t(w - c)]$  with  $t \in [0, 1]$  is a **line segment** connecting  $P$  with  $Q$ . For example,  $\vec{r}(t) = [1 + t, 1 - t, 2 + 3t]$  connects the points  $P = (1, 1, 2)$  with  $Q = (2, 0, 1)$ . 6) For  $x(t) = t \cos(t)$ ,  $y(t) = t \sin(t)$ ,  $z(t) = t$ , then

The computation is done coordinate wise:

Position	$\vec{r}(t)$	$= [\cos(3t), \sin(2t), 2 \sin(t)]$
Velocity	$\vec{r}'(t)$	$= [-3 \sin(3t), 2 \cos(2t), 2 \cos(t)]$
Acceleration	$\vec{r}''(t)$	$= [-9 \cos(3t), -4 \sin(2t), -2 \sin(t)]$
Jerk	$\vec{r}'''(t)$	$= [27 \sin(3t), 8 \cos(2t), -2 \cos(t)]$

**7.4.** Lets look at some examples of velocities and accelerations:

Example	Velocity	Example	Acceleration
Hair growth:	0.000000005 m/s	Train:	0.1-0.3 $m/s^2$
Garden Snail	0.013 m/s	Sprinter (100 m Dash):	3 $m/s^2$
Signals in nerves:	40 m/s	Car:	3-8 $m/s^2$
Sound in air:	340 m/s	Free fall:	1G = 9.81 $m/s^2$
Speed of bullet:	1200-1500 m/s	Space X BFR:	4G $m/s^2$
Earth in solar system	30'000 m/s	Combat plane F35A:	9G $m/s^2$
Sun in galaxy:	200'000 m/s	Ejection from F35A:	14G $m/s^2$ .
Light in vacuum:	299'792'458 m/s	Electron in vacuum:	$10^{15} m/s^2$

## HOMEWORK

This homework is due on Tuesday, 7/7/2020.

**Problem 7.1:** a) Sketch the plane curve

$$\vec{r}(t) = [x(t), y(t)] = [\cos(t) + \sin(2t), \sin(t) - \cos(2t)] ,$$

for  $t \in [0, 2\pi]$  by plotting the points for different values of  $t$ . Calculate its velocity  $\vec{r}'(t)$  as well as the acceleration  $\vec{r}''(t)$  at  $t = 0$ .

b) Sketch the space curve

$$\vec{r}(t) = [(10 + 3 \cos(17t)) \cos(t), (10 + 3 \cos(17t)) \sin(t), 4t + 3 \sin(17t)]$$

with  $t \in [0, 5\pi]$ .

**Problem 7.2:** Your cellphone app measures the acceleration

$$\vec{r}''(t) = [\cos(t), -\cos(9t), \sin(t)]$$

while you are riding a roller coaster. Assume you were at  $(0, 0, 0)$  at time  $t = 0$  with velocity  $(1, 0, 0)$  at  $t = 0$ , what is its position  $\vec{r}(t)$  at time  $t$ ?

**Problem 7.3:** a) Two particles travel along space curves. The first is

$$\vec{r}_1(t) = [t, t^2, t^3] .$$

The second is

$$\vec{r}_2(t) = [1 + 2t, 1 + 6t, 1 + 14t] .$$

Do the particles collide? Do the particle paths intersect?

b) If  $\vec{r}(t) = [\cos(t), 2 \sin(t), 4t]$ , find  $\vec{r}'(0)$  and  $\vec{r}''(0)$ . Then compute  $|\vec{r}'(0) \times \vec{r}''(0)|/|\vec{r}'(0)|^3$ . We will later call this the curvature.

**Problem 7.4:** Find the parameterization  $\vec{r}(t) = [x(t), y(t), z(t)]$  of the curve obtained by intersecting the elliptical cylinder  $x^2/16 + y^2/25 = 1$  with the surface  $z = x^2y$ . Find the velocity vector  $\vec{r}'(t)$  at the time  $t = \pi/2$ .

**Problem 7.5:** Consider the curve

$$\vec{r}(t) = [x(t), y(t), z(t)] = [t^2, 1 + t, 1 + t^3] .$$

Check that it passes through the point  $(1, 0, 0)$  and find the velocity vector  $\vec{r}'(t)$ , the acceleration vector  $\vec{r}''(t)$  as well as the jerk vector  $\vec{r}'''(t)$  at this point.
